Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut)** **throw (decaf::io::IOException)**

Write a object instance to data output stream.

6.131.1 Detailed Description

Marshaling code for Open Wire Format for **BaseCommandMarshaller** (p. 807). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.131.2 Constructor & Destructor Documentation

6.131.2.1 **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::BaseCommandMarshaller**
() [inline]

6.131.2.2 **virtual activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::~~BaseCommandMarshaller**
() [inline, virtual]

6.131.3 Member Function Documentation

6.131.3.1 **virtual void activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::looseMarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (
decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 204), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 258), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 383), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 411), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 459), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 572), **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 694), **activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller** (p. 933), **activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller** (p. 1330), **activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller** (p. 1338),

 (OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataInputStream * dataIn) throw (
 decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.

```
6.131.3.3  virtual int activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 205), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 259), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 384), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 412), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 460), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 573), **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 695), **activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller** (p. 934), **activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller** (p. 1331), **activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller** (p. 1339), **activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller** (p. 1402), **activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller** (p. 1449), **activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller** (p. 1512), **activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller** (p. 1542), **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1577), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1646), **activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller** (p. 1787), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1905), **activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller** (p. 2009), **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 2169), **activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller** (p. 2345), **activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller** (p. 2655), **activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller** (p. 2693), **activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller** (p. 2727), **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 2791), **activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller** (p. 2831), **activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller** (p. 3131), **activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller** (p. 3197), **activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller** (p. 3290), **activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller** (p. 3329), **activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller** (p. 3358), **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3397), **activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller** (p. 3528), **activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller** (p. 3583), and **activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller** (p. 3988).

```
6.131.3.4  virtual void activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1698).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 205), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 259), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 385), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 413), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 461), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 573), `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 696), `activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller` (p. 935), `activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller` (p. 1331), `activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller` (p. 1339), `activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller` (p. 1403), `activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller` (p. 1450), `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller` (p. 1513), `activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller` (p. 1543), `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1578), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1646), `activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller` (p. 1788), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1905), `activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller` (p. 2009), `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2170), `activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller` (p. 2346), `activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller` (p. 2656), `activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller` (p. 2694), `activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller` (p. 2728), `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 2792), `activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller` (p. 2832), `activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller` (p. 3132), `activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller` (p. 3198), `activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller` (p. 3291), `activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller` (p. 3330), `activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller` (p. 3359), `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3397), `activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller` (p. 3529), `activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller` (p. 3583), and `activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller` (p. 3988).

6.131.3.5 virtual void activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 206), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 260), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 385), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 413), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 461), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 574), **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 696), **activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller** (p. 935), **activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller** (p. 1332), **activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller** (p. 1340), **activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller** (p. 1403), **activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller** (p. 1450), **activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller** (p. 1513), **activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller** (p. 1543), **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1578), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1647), **activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller** (p. 1788), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1906), **activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller** (p. 2010), **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 2170), **activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller** (p. 2346), **activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller** (p. 2656), **activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller** (p. 2694), **activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller** (p. 2728), **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 2793), **activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller** (p. 2832), **activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller** (p. 3132), **activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller** (p. 3198), **activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller** (p. 3291), **activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller**

- virtual `~BaseDataStreamMarshaller()`
- virtual `int tightMarshal1 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual `void tightMarshal2 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual `void tightUnmarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataInputStream`

*dis AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED) throw
(**decaf::io::IOException**)

Tight Un-Marshall to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataOutputStream** *ds AMQCPP_UNUSED) throw (**decaf::io::IOException**)

Tight Marshal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataInputStream** *dis AMQCPP_UNUSED) throw (**decaf::io::IOException**)

Loose Un-Marshall to the given stream.

Static Public Member Functions

- static std::string **toString** (const **commands::MessageId** *id)
Converts the object to a String.
- static std::string **toString** (const **commands::ProducerId** *id)
Converts the object to a String.
- static std::string **toString** (const **commands::TransactionId** *txnId)
Converts the given transaction ID into a String.
- static std::string **toHexFromBytes** (const std::vector< unsigned char > &data)
given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Protected Member Functions

- virtual **commands::DataStructure** * **tightUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tight Unmarshal the cached object.
- virtual int **tightMarshalCachedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.
- virtual void **tightMarshalCachedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

- virtual void **looseMarshalCachedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

- virtual **commands::DataStructure** * **looseUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Loose Unmarshal the cached object.

- virtual int **tightMarshalNestedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

- virtual void **tightMarshalNestedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

- virtual **commands::DataStructure** * **tightUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Tight Unmarshal the nested object.

- virtual **commands::DataStructure** * **looseUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Loose Unmarshal the nested object.

- virtual void **looseMarshalNestedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Loose marshall the nested object.

- virtual std::string **tightUnmarshalString** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Performs Tight Unmarshaling of String Objects.

- virtual int **tightMarshalString1** (const std::string &value, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

- virtual void **tightMarshalString2** (const std::string &value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Tight Marshals the passed string to the streams passed.
- virtual void **looseMarshalString** (const std::string value, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Loose Marshal the String to the DataOutputStream passed.
- virtual std::string **looseUnmarshalString** (**decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Loose Un-Marshal the String to the DataOutputStream passed.
- virtual int **tightMarshalLong1** (**OpenWireFormat** *wireFormat, long long value, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Tightly marshal the long long to the BooleanStream passed.
- virtual void **tightMarshalLong2** (**OpenWireFormat** *wireFormat, long long value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Tightly marshal the long long to the Streams passed.
- virtual long long **tightUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Tight marshal the long long type.
- virtual void **looseMarshalLong** (**OpenWireFormat** *wireFormat, long long value, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Tightly marshal the long long to the BooleanStream passed.
- virtual long long **looseUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Loose marshal the long long type.
- virtual std::vector< unsigned char > **tightUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Tight Unmarshal an array of char.
- virtual std::vector< unsigned char > **looseUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Loose Unmarshal an array of char.
- virtual std::vector< unsigned char > **tightUnmarshalConstByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs, int size) throw (decaf::io::IOException)
Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

- virtual `std::vector< unsigned char > looseUnmarshalConstByteArray (decaf::io::DataInputStream *dataIn, int size) throw (decaf::io::IOException)`
Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.
- virtual `commands::DataStructure * tightUnmarshalBrokerError (OpenWireFormat *wireFormat, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Tight Unmarshal the Error object.
- virtual `int tightMarshalBrokerError1 (OpenWireFormat *wireFormat, commands::DataStructure *data, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Tight Marshal the Error object.
- virtual `void tightMarshalBrokerError2 (OpenWireFormat *wireFormat, commands::DataStructure *data, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Tight Marshal the Error object.
- virtual `commands::DataStructure * looseUnmarshalBrokerError (OpenWireFormat *wireFormat, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)`
Loose Unmarshal the Error object.
- virtual `void looseMarshalBrokerError (OpenWireFormat *wireFormat, commands::DataStructure *data, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`
Tight Marshal the Error object.
- `template<typename T >`
`int tightMarshalObjectArray1 (OpenWireFormat *wireFormat, std::vector< T > objects, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.
- `template<typename T >`
`void tightMarshalObjectArray2 (OpenWireFormat *wireFormat, std::vector< T > objects, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.
- `template<typename T >`
`void looseMarshalObjectArray (OpenWireFormat *wireFormat, std::vector< T > objects, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`

Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

- virtual std::string **readAsciiString** (decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Given an DataInputStream read a know ASCII formatted string from the input and return that string.

6.132.1 Detailed Description

Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol.

Since

2.0

6.132.2 Constructor & Destructor Documentation

- 6.132.2.1 virtual activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::~BaseDataStreamMarshaller () [inline, virtual]

6.132.3 Member Function Documentation

- 6.132.3.1 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshal (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, decaf::io::DataOutputStream *ds *AMQCPP_UNUSED*) throw (decaf::io::IOException) [inline, virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.2 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalBrokerError (OpenWireFormat * wireFormat, commands::DataStructure * data, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`
[protected, virtual]

Tight Marshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>data</i>	- Error to Marshal
<i>dataOut</i>	- stream to write marshalled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.3 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalCachedObject (OpenWireFormat * wireFormat, commands::DataStructure * data, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`
[protected, virtual]

Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>data</i>	- DataStructure Object Pointer to marshal
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.4 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalLong (OpenWireFormat * wireFormat, long long value, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`
[protected, virtual]

Tightly marshal the long long to the BooleanStream passed.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>value</i>	- long long to marshal
<i>dataOut</i>	- DataOutputStream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.5 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalNestedObject (OpenWireFormat * wireFormat, commands::DataStructure * object, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`
`[protected, virtual]`

Loose marshall the nested object.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>object</i>	- DataStructure Object Pointer to marshal
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.6 `template<typename T> void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshal (OpenWireFormat * wireFormat, std::vector< T > objects, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`
`[inline, protected]`

Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>objects</i>	- array of DataStructure object pointers.
<i>dataOut</i>	- stream to write marshalled data to

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, and AMQ_CATCHALL_THROW.

6.132.3.7 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalString (const std::string value, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [protected, virtual]

Loose Marshal the String to the DataOutputStream passed.

Parameters

<i>value</i>	- string to marshal
<i>dataOut</i>	- stream to write marshaled form to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.8 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataInputStream *dis AMQCPP_UNUSED) throw (decaf::io::IOException)` [inline, virtual]

Loose Un-Marshall to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshall
<i>dis</i>	- the DataInputStream to Un-Marshall from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.9 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalBrokerError (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [protected, virtual]

Loose Unmarshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshalled form from

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.10 `virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalByteArray (decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)`
[protected, virtual]

Loose Unmarshal an array of char.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshall from
---------------	---

Returns

the unmarshalled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.11 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalCachedObject (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)`
[protected, virtual]

Loose Unmarshal the cached object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.12 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalConstByteArray (decaf::io::DataInputStream * *dataIn*, int *size*) throw (decaf::io::IOException) [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshal from
<i>size</i>	- size of the const array to unmarshal

Returns

the unmarshaled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.13 virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalLong (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [protected, virtual]

Loose marshal the long long type.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>dataIn</i>	- stream to read marshaled form from

Returns

the unmarshaled long long

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.14 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalNestedObject (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [protected, virtual]

Loose Unmarshal the nested object.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
-------------------	---------------------------------

<i>dataIn</i>	- stream to read marshaled form from
---------------	--------------------------------------

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.15 `virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalString (decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)`
 [protected, virtual]

Loose Un-Marshal the String to the DataOuputStream passed.

Parameters

<i>dataIn</i>	- stream to read marshaled form from
---------------	--------------------------------------

Returns

the unmarshaled string

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.16 `virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::readAsciiString (decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)`
 [protected, virtual]

Given an DataInputStream read a know ASCII formatted string from the input and return that string.

Parameters

<i>dataIn</i>	- DataInputStream to read from
---------------	--------------------------------

Returns

string value read from stream

6.132.3.17 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal1 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.18 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal2 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.19 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerError1 (OpenWireFormat * wireFormat, commands::DataStructure * data, utils::BooleanStream * bs) throw (decaf::io::IOException) [protected, virtual]`

Tight Marshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- Error to Marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.20 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerError2 (OpenWireFormat * wireFormat, commands::DataStructure * data, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tight Marshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>data</i>	- Error to Marshal
<i>dataOut</i>	- stream to write marshalled data to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.21 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedObject1 (OpenWireFormat * wireFormat, commands::DataStructure * data, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>data</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.22 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedObject2 (OpenWireFormat * wireFormat, commands::DataStructure * data, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.23 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong1 (OpenWireFormat * wireFormat, long long value, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly marshal the long long to the BooleanStream passed.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>value</i>	- long long to marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.24 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong2 (OpenWireFormat * wireFormat, long long value, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly marshal the long long to the Streams passed.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
-------------------	---------------------------------

<i>value</i>	- long long to marshal
<i>dataOut</i>	- stream to write marshaled form to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.25 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject1 (OpenWireFormat * wireFormat, commands::DataStructure * object, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>object</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.26 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject2 (OpenWireFormat * wireFormat, commands::DataStructure * object, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>object</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.27 `template<typename T> int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1 (OpenWireFormat * wireFormat, std::vector< T > objects, utils::BooleanStream * bs) throw (decaf::io::IOException) [inline, protected]`

Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>objects</i>	- array of DataStructure object pointers.
<i>bs</i>	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, and AMQ_CATCHALL_THROW.

6.132.3.28 `template<typename T> void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2 (OpenWireFormat * wireFormat, std::vector< T > objects, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [inline, protected]`

Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>objects</i>	- array of DataStructure object pointers.
<i>dataOut</i>	- stream to write marshalled data to
<i>bs</i>	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, and AMQ_CATCHALL_THROW.

6.132.3.29 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString1
(const std::string & value, utils::BooleanStream * bs) throw (decaf::io::IOException) [protected, virtual]`

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

Parameters

<i>value</i>	- string to marshal
<i>bs</i>	- BooleanStream to use.

Returns

size of marshaled string.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.30 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString2
(const std::string & value, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs) throw (decaf::io::IOException)
[protected, virtual]`

Tight Marshals the passed string to the streams passed.

Parameters

<i>value</i>	- string to marshal
<i>dataOut</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.31 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshal
(OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure
*command AMQCPP_UNUSED, decaf::io::DataInputStream *dis
AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

Tight Un-Marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to Un-Marshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.32 virtual **commands::DataStructure*** **activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalBrokerError**
 (**OpenWireFormat** * *wireFormat*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**)
 [protected, virtual]

Tight Unarshall the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshalled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.33 virtual **std::vector<unsigned char>** **activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalByteArray**
 (**decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw
 (**decaf::io::IOException**) [protected, virtual]

Tight Unmarshal an array of char.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshall from
<i>bs</i>	- boolean stream to unmarshal from.

Returns

the unmarshaled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.34 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalCachedObject (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tight Unmarshal the cached object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.35 `virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalConstByteArray (decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs, int size) throw (decaf::io::IOException)` [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshall from
<i>bs</i>	- boolean stream to unmarshal from.
<i>size</i>	- size of the const array to unmarshal

Returns

the unmarshaled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.36 virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalLong
(OpenWireFormat * *wireFormat*, decaf::io::DataInputStream *
dataIn, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[protected, virtual]

Tight marshal the long long type.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

the unmarshaled long long

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.37 virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalNestedObject
(OpenWireFormat * *wireFormat*, decaf::io::DataInputStream *
dataIn, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[protected, virtual]

Tight Unmarshal the nested object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.38 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalString
(decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw
(decaf::io::IOException) [protected, virtual]

Performs Tight Unmarshaling of String Objects.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshall from
<i>bs</i>	- boolean stream to unmarshal from.

Returns

the unmarshaled string.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.132.3.39 `static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toHexFromBytes
(const std::vector< unsigned char > & data) [static]`

given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Parameters

<i>data</i>	- unsigned char data array pointer
-------------	------------------------------------

Returns

a string coded in hex that represents the data

6.132.3.40 `static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString
(const commands::TransactionId * txnId) [static]`

Converts the given transaction ID into a String.

Parameters

<i>txnId</i>	- TransactionId poitner
--------------	-------------------------

Returns

string representation of the id

6.132.3.41 `static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString
(const commands::ProducerId * id) [static]`

Converts the object to a String.

Parameters

<i>id</i>	- ProducerId pointer
-----------	----------------------

Returns

string representing the id

6.132.3.42 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString
(const commands::MessageId * *id*) [static]

Converts the object to a String.

Parameters

<i>id</i>	- MessageId pointer
-----------	---------------------

Returns

string representing the id

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getCMSMessageID().

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/**BaseDataStreamMarshaller.h**

6.133 activemq::commands::BaseDataStructure Class Reference

```
#include <src/main/activemq/commands/BaseDataStructure.h>
```

Inheritance diagram for activemq::commands::BaseDataStructure:

Public Member Functions

- virtual ~**BaseDataStructure** ()
- virtual bool **isMarshalAware** () const
Determine if this object is aware of marshaling and should have its before and after marshaling methods called.
- virtual void **beforeMarshal** (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Perform any processing needed before an marshal.
- virtual void **afterMarshal** (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Perform any processing needed after an unmarshal.

- virtual void **beforeUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Perform any processing needed before an unmarshal.
- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Perform any processing needed after an unmarshal.
- virtual void **setMarshaledForm** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED, const std::vector< char > &data AMQCPP_UNUSED)
Called to set the data to this object that will contain the objects marshaled form.
- virtual std::vector< unsigned char > **getMarshaledForm** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED)
Called to get the data to this object that will contain the objects marshaled form.
- virtual void **copyDataStructure** (const **DataStructure** *src AMQCPP_UNUSED)

Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value AMQCPP_UNUSED) const
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*

6.133.1 Constructor & Destructor Documentation

- 6.133.1.1 virtual activemq::commands::BaseDataStructure::~~BaseDataStructure ()
[inline, virtual]

6.133.2 Member Function Documentation

- 6.133.2.1 virtual void activemq::commands::BaseDataStructure::afterMarshal (**wireformat::WireFormat** *wireFormat **AMQCPP_UNUSED**) throw (**decaf::io::IOException**) [inline, virtual]

Perform any processing needed after an unmarshal.

Parameters

<i>wireformat</i>	- the OpenWireFormat object in use.
-------------------	-------------------------------------

6.133.2.2 `virtual void activemq::commands::BaseDataStructure::afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

Perform any processing needed after an unmarshal.

Parameters

<i>wireformat</i>	- the OpenWireFormat object in use.
-------------------	-------------------------------------

Reimplemented in **activemq::commands::Message** (p. 2601), and **activemq::commands::WireFormatInfo** (p. 4096).

6.133.2.3 `virtual void activemq::commands::BaseDataStructure::beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

Perform any processing needed before an marshal.

Parameters

<i>wireformat</i>	- the OpenWireFormat object in use.
-------------------	-------------------------------------

Reimplemented in **activemq::commands::Message** (p. 2601), and **activemq::commands::WireFormatInfo** (p. 4097).

6.133.2.4 `virtual void activemq::commands::BaseDataStructure::beforeUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

Perform any processing needed before an unmarshal.

Parameters

<i>wireformat</i>	- the OpenWireFormat object in use.
-------------------	-------------------------------------

6.133.2.5 `virtual void activemq::commands::BaseDataStructure::copyDataStructure (const DataStructure *src AMQCPP_UNUSED) [inline, virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented in **activemq::commands::BooleanExpression** (p. 862).

6.133.2.6 `virtual bool activemq::commands::BaseDataStructure::equals (const
DataStructure *value AMQCPP_UNUSED) const` `[inline, virtual]`

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Referenced by `activemq::commands::BooleanExpression::equals()`, and `activemq::commands::BaseCommand::equals()`.

6.133.2.7 `virtual std::vector<unsigned char> ac-
tivemq::commands::BaseDataStructure::getMarshaledForm (
wireformat::WireFormat *wireFormat AMQCPP_UNUSED)` `[inline, virtual]`

Called to get the data to this object that will contain the objects marshaled form.

Parameters

<i>wireFormat</i>	- the wireformat object to control unmarshaling
-------------------	---

Returns

buffer that holds the objects data.

6.133.2.8 `virtual bool activemq::commands::BaseDataStructure::isMarshalAware () const` `[inline, virtual]`

Determine if this object is aware of marshaling and should have its before and after marshaling methods called.

Defaults to false.

Returns

true if aware of marshaling

Implements `activemq::wireformat::MarshalAware` (p. 2566).

Reimplemented in `activemq::commands::ActiveMQMapMessage` (p. 359), `activemq::commands::Message` (p. 2607), and `activemq::commands::WireFormatInfo` (p. 4100).

6.133.2.9 `virtual void activemq::commands::BaseDataStructure::setMarshaledForm (wireformat::WireFormat *wireFormat AMQCPP_UNUSED, const std::vector< char > &data AMQCPP_UNUSED) [inline, virtual]`

Called to set the data to this object that will contain the objects marshaled form.

Parameters

<i>wireFormat</i>	- the wireformat object to control unmarshaling
<i>data</i>	- vector of object binary data

6.133.2.10 `virtual std::string activemq::commands::BaseDataStructure::toString () const [inline, virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implements **activemq::commands::DataStructure** (p. 1718).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 189), **activemq::commands::ActiveMQBytesMessage** (p. 229), **activemq::commands::ActiveMQDestination** (p. 321), **activemq::commands::ActiveMQMapMessage** (p. 364), **activemq::commands::ActiveMQMessage** (p. 392), **activemq::commands::ActiveMQObjectMessage** (p. 440), **activemq::commands::ActiveMQQueue** (p. 483), **activemq::commands::ActiveMQStreamMessage** (p. 547), **activemq::commands::ActiveMQTempDestination** (p. 582), **activemq::commands::ActiveMQTempQueue** (p. 611), **activemq::commands::ActiveMQTempTopic** (p. 641), **activemq::commands::ActiveMQTextMessage** (p. 671), **activemq::commands::ActiveMQTopic** (p. 701), **activemq::commands::BaseCommand** (p. 770), **activemq::commands::BooleanExpression** (p. 863), **activemq::commands::BrokerId** (p. 877), **activemq::commands::BrokerInfo** (p. 908), **activemq::commands::Command** (p. 1231), **activemq::commands::ConnectionControl** (p. 1305), **activemq::commands::ConnectionError** (p. 1335), **activemq::commands::ConnectionId** (p. 1368), **activemq::commands::ConnectionInfo** (p. 1398), **activemq::commands::ConsumerControl** (p. 1445), **activemq::commands::ConsumerId** (p. 1476), **activemq::commands::ConsumerInfo** (p. 1507), **activemq::commands::ControlCommand** (p. 1538), **activemq::commands::DataArrayResponse** (p. 1574), **activemq::commands::DataResponse** (p. 1634), **activemq::commands::DestinationInfo** (p. 1783), **activemq::commands::DiscoveryEvent** (p. 1814), **activemq::commands::ExceptionResponse** (p. 1897), **activemq::commands::FlushCommand** (p. 2001), **activemq::commands::IntegerResponse** (p. 2162), **activemq::commands::JournalQueueAck** (p. 2227), **activemq::commands::JournalTopicAck** (p. 2255), **activemq::commands::JournalTrace** (p. 2283), **activemq::commands::JournalTransaction** (p. 2310), **activemq::commands::KeepAliveInfo** (p. 2337), **activemq::commands::LastPartialCommand** (p. 2373), **activemq::commands::LocalTransactionId** (p. 2424), **activemq::commands::Message** (p. 2611), **activemq::commands::MessageAck** (p. 2647), **activemq::commands::MessageDispatch** (p. 2682), **activemq::commands::MessageDispatchNotification** (p. 2719), **activemq::commands::MessageId** (p. 2754), **activemq::commands::MessagePull** (p. 2827), **activemq::commands::NetworkBridgeFilter** (p. 2880), **activemq::commands::PartialCommand** (p. 3005), **activemq::commands::ProducerAck** (p. 3127), **activemq::commands::ProducerId** (p. 3160), **activemq::commands::ProducerInfo** (p. 3189), **activemq::commands::RemoveInfo**

(p. 3287), **activemq::commands::RemoveSubscriptionInfo** (p. 3317), **activemq::commands::ReplayComm** (p. 3346), **activemq::commands::Response** (p. 3382), **activemq::commands::SessionId** (p. 3480), **activemq::commands::SessionInfo** (p. 3507), **activemq::commands::ShutdownInfo** (p. 3575), **activemq::commands::SubscriptionInfo** (p. 3785), **activemq::commands::TransactionId** (p. 3935), **activemq::commands::TransactionInfo** (p. 3963), **activemq::commands::WireFormatInfo** (p. 4104), and **activemq::commands::XATransactionId** (p. 4146).

Referenced by **activemq::commands::BooleanExpression::toString()**, and **activemq::commands::BaseCommand**.

```

Inheritance diagram for **decaf::net::BindException**:

Public Member Functions

- **BindException** () throw ()
Default Constructor.
- **BindException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **BindException** (const **BindException** &ex) throw ()
Copy Constructor.
- **BindException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.

- **BindException** (const std::exception ***cause**) throw ()
Constructor.
- **BindException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **BindException** * **clone** () const
Clones this exception.
- virtual ~**BindException** () throw ()

6.135.1 Constructor & Destructor Documentation

6.135.1.1 decaf::net::BindException::BindException () throw () [inline]

Default Constructor.

6.135.1.2 decaf::net::BindException::BindException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.135.1.3 decaf::net::BindException::BindException (const BindException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.135.1.4 decaf::net::BindException::BindException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
-------------	--------------------------------------

<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.135.1.5 `decaf::net::BindException::BindException (const std::exception * cause) throw ()`
`[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.135.1.6 `decaf::net::BindException::BindException (const char * file, const int lineNumber,
const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.135.1.7 `virtual decaf::net::BindException::~~BindException () throw ()` `[inline, virtual]`

6.135.2 Member Function Documentation

6.135.2.1 `virtual BindException* decaf::net::BindException::clone () const` `[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 3629).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**BindException.h**

6.136 decaf::io::BlockingByteArrayInputStream Class Reference

This is a blocking version of a byte buffer stream.

```
#include <src/main/decaf/io/BlockingByteArrayInputStream.h>
```

Inheritance diagram for decaf::io::BlockingByteArrayInputStream:

Public Member Functions

- **BlockingByteArrayInputStream** ()
Default Constructor - uses a default internal buffer.
- **BlockingByteArrayInputStream** (const unsigned char *buffer, int bufferSize)
Constructor that initializes the internal buffer.
- virtual ~**BlockingByteArrayInputStream** ()
- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize)

- virtual int **available** () const throw (decaf::io::IOException)
*Indicates the number of bytes available.
The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.
The default implementation of this method returns zero.*

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual void **close** () throw (decaf::io::IOException)
*Closes the **InputStream** (p. 2105) freeing any resources that might have been acquired during the lifetime of this stream.
The default implementation of this method does nothing.*
- virtual long long **skip** (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

*The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num	The number of bytes to skip.
-----	------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
UnsupportedOperationException	<i>if the concrete stream class does not support skipping bytes.</i>

Protected Member Functions

- virtual int **doReadByte** () throw (IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

6.136.1 Detailed Description

This is a blocking version of a byte buffer stream. Read operations block until the requested data becomes available in the internal buffer via a call to `setByteArray`.

6.136.2 Constructor & Destructor Documentation

6.136.2.1 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream ()

Default Constructor - uses a default internal buffer.

6.136.2.2 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream (const unsigned char * buffer, int bufferSize)

Constructor that initializes the internal buffer.

See also

setByteArray (p. 848).

6.136.2.3 `virtual decaf::io::BlockingByteArrayInputStream::~~BlockingByteArrayInputStream () [virtual]`

6.136.3 Member Function Documentation

6.136.3.1 `virtual int decaf::io::BlockingByteArrayInputStream::available () const throw (decaf::io::IOException) [virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 2107).

6.136.3.2 `virtual void decaf::io::BlockingByteArrayInputStream::close () throw (decaf::io::IOException) [virtual]`

Closes the **InputStream** (p. 2105) freeing any resources that might have been aquired during the lifetime of this stream.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::InputStream** (p. 2108).

6.136.3.3 `virtual int decaf::io::BlockingByteArrayInputStream::doReadArrayBounded (unsigned char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException) [protected, virtual]`

Reimplemented from **decaf::io::InputStream** (p. 2108).

6.136.3.4 `virtual int decaf::io::BlockingByteArrayInputStream::doReadByte () throw (IOException) [protected, virtual]`

Implements **decaf::io::InputStream** (p. 2109).

6.136.3.5 `virtual void decaf::io::BlockingByteArrayInputStream::setByteArray (const unsigned char * buffer, int bufferSize)` [virtual]

6.136.3.6 `virtual long long decaf::io::BlockingByteArrayInputStream::skip (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error occurs.
<i>UnsupportedOperationException</i>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 2113).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/BlockingByteArrayInputStream.h`

6.137 decaf::util::concurrent::BlockingQueue< E > Class Template Reference

A **decaf::util::Queue** (p. 3239) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.

```
#include <src/main/decaf/util/concurrent/BlockingQueue.h>
```

6.137 decaf::util::concurrent::BlockingQueue< E > Class Template Reference 849

Inheritance diagram for decaf::util::concurrent::BlockingQueue< E >:

Public Member Functions

- virtual **~BlockingQueue** ()
- virtual void **put** (const E &value)=0 throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Inserts the specified element into this queue, waiting if necessary for space to become available.

- virtual bool **offer** (const E &e, long timeout, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

- virtual E **take** ()=0 throw (decaf::lang::exceptions::InterruptedException)

Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

- virtual bool **poll** (E &result, long long timeout, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::InterruptedException)

Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

- virtual int **remainingCapacity** () const =0

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or Integer::MAX_VALUE if there is no intrinsic limit.

- virtual std::size_t **drainTo** (**Collection**< E > &c)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)

Removes all available elements from this queue and adds them to the given collection.

- virtual std::size_t **drainTo** (**Collection**< E > &c, std::size_t maxElements)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)

Removes at most the given number of available elements from this queue and adds them to the given collection.

6.137.1 Detailed Description

`template<typename E> class decaf::util::concurrent::BlockingQueue< E >`

A **decaf::util::Queue** (p. 3239) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element. **BlockingQueue** (p. 848) methods come in four forms, with different ways of handling operations that cannot be satisfied immediately, but may be satisfied at some point in the future: one throws an exception, the second returns a special value (either `true` or `false`, depending on the operation), the third blocks the current thread indefinitely until the operation can succeed, and the fourth blocks for only a given maximum time limit before giving up. These methods are summarized in the following table:

	<i>Throws exception</i>	<i>Boolean Flag</i>	<i>Blocks</i>	<i>Times out</i>
Insert	add(e) (p. 177)	offer(e) (p. 853)	put(e) (p. 854)	offer(e, time, unit) (p. ??)
Remove	remove() (p. 179)	poll() (p. 854)	take() (p. 855)	poll(time, unit) (p. ??)
Examine	element() (p. 178)	peek() (p. 3242)	<i>not applicable</i>	<i>not applicable</i>

A **BlockingQueue** (p. 848) may be capacity bounded. At any given time it may have a `remainingCapacity` beyond which no additional elements can be put without blocking. A **BlockingQueue** (p. 848) without any intrinsic capacity constraints always reports a remaining capacity of `Integer::MAX_VALUE`.

BlockingQueue (p. 848) implementations are designed to be used primarily for producer-consumer queues, but additionally support **decaf::util::Collection** (p. 1216) interface. So, for example, it is possible to remove an arbitrary element from a queue using `remove(x)`. However, such operations are in general *not* performed very efficiently, and are intended for only occasional use, such as when a queued message is cancelled.

BlockingQueue (p. 848) implementations are thread-safe. All queuing methods achieve their effects atomically using internal locks or other forms of concurrency control. However, the *bulk* **Collection** (p. 1216) operations `addAll`, `containsAll`, `retainAll` and `removeAll` are *not* necessarily performed atomically unless specified otherwise in an implementation. So it is possible, for example, for `addAll(c)` to fail (throwing an exception) after adding only some of the elements in `c`.

A **BlockingQueue** (p. 848) does *not* intrinsically support any kind of "close" or "shutdown" operation to indicate that no more items will be added. The needs and usage of such features tend to be implementation-dependent. For example, a common tactic is for producers to insert special *end-of-stream* or *poison* objects, that are interpreted accordingly when taken by consumers.

Usage example, based on a typical producer-consumer scenario. Note that a **BlockingQueue** (p. 848) can safely be used with multiple producers and multiple consumers.

```
class Producer : public Runnable {
private:
```

6.137 decaf::util::concurrent::BlockingQueue< E > Class Template Reference 851

```
    BlockingQueue* queue;

public:

    Producer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
        try {
            while( true ) { queue->put( produce() ); }
        } catch( InterruptedException& ex ) { ... handle ...}
    }

    Object produce() { ... }
}

class Consumer : public Runnable {
private:

    BlockingQueue* queue;

public:

    Consumer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
        try {
            while( true ) { consume( queue->take() (p.855) ); }
        } catch( InterruptedException& ex ) { ... handle ...}
    }

    void consume( Object& x ) { ... }
}

int main( int argc, char** argv ) {

    BlockingQueue (p.848) q = new SomeQueueImplementation();
    Producer p( &q );
    Consumer c1( &q );
    Consumer c2( &q );
    Thread t1( &p ).start();
    Thread t2( &c1 ).start();
    Thread t3( &c2 ).start();
}
```

Memory consistency effects: As with other concurrent collections, actions in a thread prior to placing an object into a **BlockingQueue** (p.848) *happen-before* actions subsequent to the access or removal of that element from the **BlockingQueue** (p.848) in another thread.

Since

1.0

6.137.2 Constructor & Destructor Documentation

6.137.2.1 `template<typename E> virtual decaf::util::concurrent::BlockingQueue< E>::~~BlockingQueue() [inline, virtual]`

6.137.3 Member Function Documentation

6.137.3.1 `template<typename E> virtual std::size_t decaf::util::concurrent::BlockingQueue< E>::drainTo(Collection< E> & c) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]`

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

<code>c</code>	the collection to transfer elements into
----------------	--

Returns

the number of elements transferred

Exceptions

<i>UnsupportedOperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgumentException</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implemented in `decaf::util::concurrent::SynchronousQueue< E>` (p. 3831).

6.137.3.2 `template<typename E> virtual std::size_t decaf::util::concurrent::BlockingQueue< E>::drainTo(Collection< E> & c, std::size_t maxElements) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]`

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection `c` may result in

6.137 `decaf::util::concurrent::BlockingQueue< E >` Class Template Reference 853

elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

<i>c</i>	the collection to transfer elements into
<i>maxElements</i>	the maximum number of elements to transfer

Returns

the number of elements transferred

Exceptions

<i>UnsupportedOperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgumentException</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3832).

```
6.137.3.3 template<typename E> virtual bool
decaf::util::concurrent::BlockingQueue< E >::offer
( const E & e, long timeout, const TimeUnit & unit )
throw ( decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException ) [pure
virtual]
```

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Parameters

<i>e</i>	the element to add
<i>timeout</i>	how long to wait before giving up, in units of <i>unit</i>
<i>unit</i>	a TimeUnit (p. 3919) determining how to interpret the <i>timeout</i> parameter

Returns

`true` if successful, or `false` if the specified waiting time elapses before space is available

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
-----------------------------	------------------------------

<i>NullPointerException</i>	if the specified element is null
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3833).

```
6.137.3.4  template<typename E > virtual bool
           decaf::util::concurrent::BlockingQueue< E >::poll ( E
           & result, long long timeout, const TimeUnit & unit ) throw (
           decaf::lang::exceptions::InterruptedException ) [pure virtual]
```

Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

Parameters

<i>result</i>	the referenced value that will be assigned the value retrieved from the Queue (p. 3239). Undefined if this methods returned false.
<i>timeout</i>	how long to wait before giving up, in units of <i>unit</i>
<i>unit</i>	a TimeUnit (p. 3919) determining how to interpret the <i>timeout</i> parameter.

Returns

`true` if successful or `false` if the specified waiting time elapses before an element is available.

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
-----------------------------	------------------------------

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3834).

```
6.137.3.5  template<typename E > virtual void
           decaf::util::concurrent::BlockingQueue< E >::put (
           const E & value ) throw ( decaf::lang::exceptions::InterruptedException,
           decaf::lang::exceptions::NullPointerException,
           decaf::lang::exceptions::IllegalArgumentException ) [pure
           virtual]
```

Inserts the specified element into this queue, waiting if necessary for space to become available.

Parameters

<i>value</i>	the element to add
--------------	--------------------

6.137 `decaf::util::concurrent::BlockingQueue< E >` Class Template Reference 855

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
<i>NullPointerException</i>	if the specified element is null
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3835).

6.137.3.6 `template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::remainingCapacity () const` [pure virtual]

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns

the remaining capacity

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3836).

6.137.3.7 `template<typename E> virtual E decaf::util::concurrent::BlockingQueue< E >::take () throw (decaf::lang::exceptions::InterruptedException)` [pure virtual]

Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Returns

the head of this queue

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
-----------------------------	------------------------------

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3837).

The Class object representing the primitive type boolean.

6.138.1 Constructor & Destructor Documentation

6.138.1.1 decaf::lang::Boolean::Boolean (bool value)

Parameters

<i>value</i>	- primitive boolean to wrap.
--------------	------------------------------

6.138.1.2 decaf::lang::Boolean::Boolean (const std::string & value)

Parameters

<i>value</i>	- String (p. 3775) value to convert to a boolean.
--------------	--

6.138.1.3 virtual decaf::lang::Boolean::~~Boolean () [inline, virtual]

6.138.2 Member Function Documentation

6.138.2.1 bool decaf::lang::Boolean::booleanValue () const [inline]

Returns

the primitive boolean value of this object

6.138.2.2 virtual int decaf::lang::Boolean::compareTo (const Boolean & b) const [virtual]

Compares this **Boolean** (p. 856) instance with another.

Parameters

<i>b</i>	- the Boolean (p. 856) instance to be compared
----------	---

Returns

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements **decaf::lang::Comparable**< **Boolean** > (p. 1249).

6.138.2.3 `virtual int decaf::lang::Boolean::compareTo (const bool & b) const` [virtual]

Compares this **Boolean** (p. 856) instance with another.

Parameters

<i>b</i>	- the Boolean (p. 856) instance to be compared
----------	---

Returns

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements **decaf::lang::Comparable**< **bool** > (p. 1249).

6.138.2.4 `bool decaf::lang::Boolean::equals (const bool & b) const` [inline, virtual]

Returns

true if the two **Boolean** (p. 856) Objects have the same value.

Implements **decaf::lang::Comparable**< **bool** > (p. 1250).

6.138.2.5 `bool decaf::lang::Boolean::equals (const Boolean & b) const` [inline, virtual]

Returns

true if the two **Boolean** (p. 856) Objects have the same value.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 1250).

6.138.2.6 `virtual bool decaf::lang::Boolean::operator< (const bool & value) const` [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **bool** > (p. 1250).

6.138.2.7 `virtual bool decaf::lang::Boolean::operator< (const Boolean & value) const`
[virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 1250).

6.138.2.8 `virtual bool decaf::lang::Boolean::operator== (const bool & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **bool** > (p. 1250).

6.138.2.9 `virtual bool decaf::lang::Boolean::operator== (const Boolean & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 1250).

6.138.2.10 `static bool decaf::lang::Boolean::parseBoolean (const std::string & value)`
[static]

Parses the **String** (p. 3775) passed and extracts an bool.

Parameters

<i>value</i>	The std::string value to parse
--------------	--------------------------------

Returns

bool value

6.138.2.11 `static std::string decaf::lang::Boolean::toString (bool value)` [static]

Converts the bool to a **String** (p. 3775) representation.

Parameters

<i>value</i>	The bool value to convert.
--------------	----------------------------

Returns

std::string representation of the bool value passed.

6.138.2.12 `std::string decaf::lang::Boolean::toString () const`

Returns

the string representation of this Booleans value.

6.138.2.13 `static Boolean decaf::lang::Boolean::valueOf (bool value)` [static]

Parameters

<i>value</i>	The bool value to convert to a Boolean (p. 856) instance.
--------------	--

Returns

a **Boolean** (p. 856) instance of the primitive boolean value

6.138.2.14 `static Boolean decaf::lang::Boolean::valueOf (const std::string & value)`
`[static]`

Parameters

<i>value</i>	The std::string value to convert to a Boolean (p. 856) instance.
--------------	---

Returns

a **Boolean** (p. 856) instance of the string value

6.138.3 Field Documentation

6.138.3.1 `const Boolean decaf::lang::Boolean::_FALSE` `[static]`

The Class object representing the primitive false boolean.

6.138.3.2 `const Boolean decaf::lang::Boolean::_TRUE` `[static]`

The Class object representing the primitive type boolean.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Boolean.h`

6.139 activemq::commands::BooleanExpression Class Reference

```
#include <src/main/activemq/commands/BooleanExpression.h>
```

Inheritance diagram for activemq::commands::BooleanExpression:

Public Member Functions

- **BooleanExpression** ()
- virtual **~BooleanExpression** ()
- virtual **DataStructure * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src AMQCPP_UNUSED)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

- virtual bool **equals** (const **DataStructure** *value) const

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

6.139.1 Constructor & Destructor Documentation

6.139.1.1 **activemq::commands::BooleanExpression::BooleanExpression** () [inline]

6.139.1.2 **virtual activemq::commands::BooleanExpression::~~BooleanExpression** () [inline, virtual]

6.139.2 Member Function Documentation

6.139.2.1 **virtual DataStructure* activemq::commands::BooleanExpression::cloneDataStructure** () const [inline, virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

6.139.2.2 **virtual void activemq::commands::BooleanExpression::copyDataStructure** (const **DataStructure** *src *AMQCPP_UNUSED*) [inline, virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseDataStructure** (p. 839).

6.139.2.3 **virtual bool activemq::commands::BooleanExpression::equals** (const **DataStructure** *value) const [inline, virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

6.140 `activemq::wireformat::openwire::utils::BooleanStream` Class Reference 863

Returns

true if `DataStream`'s are Equal.

Implements `activemq::commands::DataStream` (p. 1716).

References `activemq::commands::BaseDataStream::equals()`.

6.139.2.4 `virtual std::string activemq::commands::BooleanExpression::toString () const`
`[inline, virtual]`

Returns a string containing the information for this `DataStream` (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStream` (p. 841).

References `activemq::commands::BaseDataStream::toString()`.

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/BooleanExpression.h`

6.140 `activemq::wireformat::openwire::utils::BooleanStream` Class Reference

Manages the writing and reading of boolean data streams to and from a data source such as a `DataInputStream` or `DataOutputStream`.

```
#include <src/main/activemq/wireformat/openwire/utils/BooleanStream.h>
```

Public Member Functions

- `BooleanStream ()`
- `virtual ~BooleanStream ()`
- `bool readBoolean () throw (decaf::io::IOException)`
Read a boolean data element from the internal data buffer.
- `void writeBoolean (bool value) throw (decaf::io::IOException)`
Writes a Boolean value to the internal data buffer.
- `void marshal (decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`
Marshal the data to a DataOutputStream.

- void **marshal** (std::vector< unsigned char > &dataOut)
Marshal the data to a STL vector of unsigned chars.
- void **unmarshal** (decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Unmarshal a Boolean data stream from the Input Stream.
- void **clear** ()
Clears to old position markers, data starts at the beginning.
- int **marshalledSize** ()
Calc the size that data is marshalled to.

6.140.1 Detailed Description

Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream. The booleans are stored as single bits in the stream, with the stream size pre-pended to the stream when the data is marshalled.

The serialized form of the size field can be between 1 and 3 bytes. If the number of used bytes < 64, size=1 byte If the number of used bytes >=64 and < 256 (size of an unsigned byte), size=2 bytes If the number of used bytes >=256, size=3 bytes

The high-order 2 bits (128 and 64) of the first byte of the size field are used to encode the information about the number of bytes in the size field. The only time the first byte will contain a value >=64 is if there are more bytes in the size field. If the first byte < 64, the value of the byte is simply the size value. If the first byte = 0xC0, the following unsigned byte is the size field. If the first byte = 0x80, the following short (two bytes) are the size field.

6.140.2 Constructor & Destructor Documentation

6.140.2.1 **activemq::wireformat::openwire::utils::BooleanStream::BooleanStream ()**

6.140.2.2 **virtual activemq::wireformat::openwire::utils::BooleanStream::~~BooleanStream ()**
[inline, virtual]

6.140.3 Member Function Documentation

6.140.3.1 **void activemq::wireformat::openwire::utils::BooleanStream::clear ()**

Clears to old position markers, data starts at the beginning.

6.140.3.2 **void activemq::wireformat::openwire::utils::BooleanStream::marshal (std::vector< unsigned char > & dataOut)**

Marshal the data to a STL vector of unsigned chars.

6.140 activemq::wireformat::openwire::utils::BooleanStream Class Reference 865

Parameters

<i>dataOut</i>	- reference to a vector to write the data to.
----------------	---

6.140.3.3 void activemq::wireformat::openwire::utils::BooleanStream::marshal (decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException)

Marshal the data to a DataOutputStream.

Parameters

<i>dataOut</i>	- Stream to write the data to.
----------------	--------------------------------

6.140.3.4 int activemq::wireformat::openwire::utils::BooleanStream::marshalledSize ()

Calc the size that data is marshalled to.

Returns

int size of marshalled data.

6.140.3.5 bool activemq::wireformat::openwire::utils::BooleanStream::readBoolean () throw (decaf::io::IOException)

Read a boolean data element from the internal data buffer.

Returns

boolean from the stream

6.140.3.6 void activemq::wireformat::openwire::utils::BooleanStream::unmarshal (decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException)

Unmarshal a Boolean data stream from the Input Stream.

Parameters

<i>dataIn</i>	- Input Stream to read data from.
---------------	-----------------------------------

6.140.3.7 void activemq::wireformat::openwire::utils::BooleanStream::writeBoolean (bool *value*) throw (decaf::io::IOException)

Writes a Boolean value to the internal data buffer.

Parameters

<i>value</i>	- boolean data to write.
--------------	--------------------------

Clones this exception.
- virtual ~**BrokenBarrierException** () throw ()

6.141.1 Constructor & Destructor Documentation

6.141.1.1 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException () throw ()` `[inline]`

Default Constructor.

6.141.1.2 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const decaf::lang::Exception & ex) throw ()` `[inline]`

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.141.1.3 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const BrokenBarrierException & ex) throw ()` `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	The Exception to copy in this new instance.
-----------	---

6.141.1.4 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const std::exception * cause) throw ()` `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.141.1.5 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * file, const int lineNumber, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>msg</i>	- The message to report

...	- list of primitives that are formatted into the message
-----	--

6.141.1.6 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.
Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>cause</i>	- The exception that was the cause for this one to be thrown.
<i>msg</i>	- The message to report
...	- list of primitives that are formatted into the message

6.141.1.7 `virtual decaf::util::concurrent::BrokenBarrierException::~~BrokenBarrierException () throw () [inline, virtual]`

6.141.2 Member Function Documentation

6.141.2.1 `virtual BrokenBarrierException* decaf::util::concurrent::BrokenBarrierException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from `decaf::lang::Exception` (p. 1889).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/BrokenBarrierException.h`

6.142 activemq::commands::BrokerError Class Reference

This class represents an Exception sent from the Broker.

```
#include <src/main/activemq/commands/BrokerError.h>
```

Inheritance diagram for activemq::commands::BrokerError:

Data Structures

- struct **StackTraceElement**

Public Member Functions

- **BrokerError** ()
- virtual **~BrokerError** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1713) Type as defined in CommandTypes.h.*
- virtual **BrokerError** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- virtual const std::string & **getMessage** () const
Gets the string holding the error message.
- virtual void **setMessage** (const std::string &message)
*Sets the string that contains the error **Message** (p. 2596).*
- virtual const std::string & **getExceptionClass** () const
Gets the string holding the Exception Class name.
- virtual void **setExceptionClass** (const std::string &exceptionClass)
Sets the string that contains the Exception Class name.
- virtual const **decaf::lang::Pointer**< **BrokerError** > & **getCause** () const
Gets the Broker Error that caused this exception.
- virtual void **setCause** (const **decaf::lang::Pointer**< **BrokerError** > &cause)
Sets the Broker Error that caused this exception.

- virtual const std::vector< **decaf::lang::Pointer**< **StackTraceElement** > > &**getStackTraceElements** () const
Gets the Stack Trace Elements for the Exception.
- virtual void **setStackTraceElements** (const std::vector< **decaf::lang::Pointer**< **StackTraceElement** > > &stackTraceElements)
Sets the Stack Trace Elements for this Exception.

6.142.1 Detailed Description

This class represents an Exception sent from the Broker. The Broker sends java Throwables, so we must mimic its structure here.

6.142.2 Constructor & Destructor Documentation

6.142.2.1 **activemq::commands::BrokerError::BrokerError** ()

6.142.2.2 **virtual activemq::commands::BrokerError::~~BrokerError** () [virtual]

6.142.3 Member Function Documentation

6.142.3.1 **virtual BrokerError* activemq::commands::BrokerError::cloneDataStructure** ()
const [inline, virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

References copyDataStructure().

6.142.3.2 **virtual void activemq::commands::BrokerError::copyDataStructure** (**const DataStructure * src**) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

Referenced by cloneDataStructure().

6.142.3.3 `virtual const decaf::lang::Pointer<BrokerError>&
activemq::commands::BrokerError::getCause () const [inline,
virtual]`

Gets the Broker Error that caused this exception.

Returns

Broker Error Pointer

6.142.3.4 `virtual unsigned char activemq::commands::BrokerError::getDataStructureType ()
const [inline, virtual]`

Get the **DataStructure** (p. 1713) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1717).

6.142.3.5 `virtual const std::string& activemq::commands::BrokerError::getExceptionClass ()
const [inline, virtual]`

Gets the string holding the Exception Class name.

Returns

Exception Class name

6.142.3.6 `virtual const std::string& activemq::commands::BrokerError::getMessage () const
[inline, virtual]`

Gets the string holding the error message.

Returns

String **Message** (p. 2596)

6.142.3.7 `virtual const std::vector< decaf::lang::Pointer<StackTraceElement> >&
activemq::commands::BrokerError::getStackTraceElements () const [inline,
virtual]`

Gets the Stack Trace Elements for the Exception.

Returns

Stack Trace Elements

6.142.3.8 `virtual void activemq::commands::BrokerError::setCause (const
decaf::lang::Pointer< BrokerError > & cause) [inline,
virtual]`

Sets the Broker Error that caused this exception.

Parameters

<i>cause</i>	- Broker Error
--------------	----------------

6.142.3.9 `virtual void activemq::commands::BrokerError::setExceptionClass (const std::string
& exceptionClass) [inline, virtual]`

Sets the string that contains the Exception Class name.

Parameters

<i>exception- Class</i>	- String Exception Class name
-----------------------------	-------------------------------

6.142.3.10 `virtual void activemq::commands::BrokerError::setMessage (const std::string &
message) [inline, virtual]`

Sets the string that contains the error **Message** (p. 2596).

Parameters

<i>message</i>	- String Error Message (p. 2596)
----------------	---

6.142.3.11 `virtual void activemq::commands::BrokerError::setStackTraceElements (const
std::vector< decaf::lang::Pointer< StackTraceElement > > &
stackTraceElements) [inline, virtual]`

Sets the Stack Trace Elements for this Exception.

Parameters

<i>stack- TraceEle- ments</i>	- Stack Trace Elements
---------------------------------------	------------------------

6.142.3.12 `virtual decaf::lang::Pointer<commands::Command>
 activemq::commands::BrokerError::visit (activemq::state::CommandVisitor
 * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**BrokerError.h**

6.143 activemq::exceptions::BrokerException Class Reference

```

Protected Attributes

- std::string **value**

6.144.1 Member Typedef Documentation

6.144.1.1 `typedef decaf::lang::PointerComparator<BrokerId>
activemq::commands::BrokerId::COMPARATOR`

6.144.2 Constructor & Destructor Documentation

6.144.2.1 `activemq::commands::BrokerId::BrokerId ()`

6.144.2.2 `activemq::commands::BrokerId::BrokerId (const BrokerId & other)`

6.144.2.3 `virtual activemq::commands::BrokerId::~~BrokerId () [virtual]`

6.144.3 Member Function Documentation

6.144.3.1 `virtual BrokerId* activemq::commands::BrokerId::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.144.3.2 `virtual int activemq::commands::BrokerId::compareTo (const BrokerId & value)
const [virtual]`

6.144.3.3 `virtual void activemq::commands::BrokerId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Implements `activemq::commands::DataStructure` (p. 1715).

6.144.3.4 `virtual bool activemq::commands::BrokerId::equals (const DataStructure * value
)const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

6.144.3.5 `virtual bool activemq::commands::BrokerId::equals (const BrokerId & value)
const [virtual]`

6.144.3.6 `virtual unsigned char activemq::commands::BrokerId::getDataStructureType ()
const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

6.144.3.7 `virtual const std::string& activemq::commands::BrokerId::getValue () const
[virtual]`

6.144.3.8 `virtual std::string& activemq::commands::BrokerId::getValue () [virtual]`

6.144.3.9 `virtual bool activemq::commands::BrokerId::operator< (const BrokerId & value)
const [virtual]`

6.144.3.10 `BrokerId& activemq::commands::BrokerId::operator= (const BrokerId & other)`

6.144.3.11 `virtual bool activemq::commands::BrokerId::operator== (const BrokerId & value)
const [virtual]`

6.144.3.12 `virtual void activemq::commands::BrokerId::setValue (const std::string & value)
[virtual]`

6.144.3.13 `virtual std::string activemq::commands::BrokerId::toString () const
[virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

6.144.4 Field Documentation

6.144.4.1 `const unsigned char activemq::commands::BrokerId::ID_BROKERID = 124` `[static]`

6.144.4.2 `std::string activemq::commands::BrokerId::value` `[protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/BrokerId.h`

6.145 `activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller` Class Reference

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 878).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/BrokerIdMarshal
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller`:

Public Member Functions

- **BrokerIdMarshaller** ()
- virtual `~BrokerIdMarshaller` ()
- virtual `commands::DataStructure * createObject` () const
Creates a new instance of this marshalable type.
- virtual unsigned char `getDataStructureType` () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void `tightUnmarshal` (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `decaf::io::DataInputStream *dataIn`, `utils::BooleanStream *bs`) throw (`decaf::io::IOException`)
Un-marshal an object instance from the data input stream.
- virtual int `tightMarshal1` (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `utils::BooleanStream *bs`) throw (`decaf::io::IOException`)
Write the booleans that this object uses to a BooleanStream.
- virtual void `tightMarshal2` (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `decaf::io::DataOutputStream *dataOut`, `utils::BooleanStream *bs`) throw (`decaf::io::IOException`)
Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.145.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 878). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.145.2 Constructor & Destructor Documentation

6.145.2.1 **activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::BrokerIdMarshaller**
() [inline]

6.145.2.2 **virtual activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::~~BrokerIdMarshaller**
() [inline, virtual]

6.145.3 Member Function Documentation

6.145.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.145.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::getDataStructureType**
() **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.145.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1675).

6.145.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1683).

6.145.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

6.145 activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller Class Reference 881

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.145.3.6 virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.145.3.7 virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.

<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**BrokerIdMarshaller.h**

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.146.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.146 activemq::wireformat::openwire::marshal::v4::BrokerIdMarshaller Class Reference 885

6.146.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.146.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.146.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1706).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/BrokerIdMarshaller.h`

6.147 `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` Class Reference

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 886).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/BrokerIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller`:

Public Member Functions

- **BrokerIdMarshaller** ()
- virtual `~BrokerIdMarshaller` ()
- virtual `commands::DataStructure * createObject` () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.147.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 886). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.147.2 Constructor & Destructor Documentation

6.147.2.1 **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::BrokerIdMarshaller**
() [inline]

6.147.2.2 **virtual activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::~~BrokerIdMarshaller**
() [inline, virtual]

6.147.3 Member Function Documentation

6.147.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.147.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.147.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.147.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

6.147 activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller Class Reference 889

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.147.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.147.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.147.3.7 virtual void activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
  * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.148.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

6.148 activemq::wireformat::openwire::marshal::v5::BrokerIdMarshaller Class Reference 893

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

```
6.148.3.5 virtual int activemq::wireformat::openwire::marshal::v5::BrokerIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.148.3.6 virtual void activemq::wireformat::openwire::marshal::v5::BrokerIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.148.3.7 virtual void activemq::wireformat::openwire::marshal::v5::BrokerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

6.150.3 Member Function Documentation

- 6.150.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.150.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.150.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.150.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

6.150 activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller Class Reference 901

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.150.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.150.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1698).

6.150.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1706).

The documentation for this class was generated from the following file:

6.151 activemq::commands::BrokerInfo Class Reference

```
#include <src/main/activemq/commands/BrokerInfo.h>
```

Inheritance diagram for `activemq::commands::BrokerInfo`:

Public Member Functions

- **BrokerInfo** ()
- virtual **~BrokerInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **BrokerInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*

6.151.1 Constructor & Destructor Documentation

6.151.1.1 **activemq::commands::BrokerInfo::BrokerInfo ()**

6.151.1.2 **virtual activemq::commands::BrokerInfo::~~BrokerInfo ()** [virtual]

6.151.2 Member Function Documentation

6.151.2.1 **virtual BrokerInfo* activemq::commands::BrokerInfo::cloneDataStructure ()**
const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

6.151.2.2 **virtual void activemq::commands::BrokerInfo::copyDataStructure (const DataStructure * src)** [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

6.151.2.3 `virtual bool activemq::commands::BrokerInfo::equals (const DataStructure *
value) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

- 6.151.2.4 `virtual const Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId () const [virtual]`
- 6.151.2.5 `virtual Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId () [virtual]`
- 6.151.2.6 `virtual std::string& activemq::commands::BrokerInfo::getBrokerName () [virtual]`
- 6.151.2.7 `virtual const std::string& activemq::commands::BrokerInfo::getBrokerName () const [virtual]`
- 6.151.2.8 `virtual const std::string& activemq::commands::BrokerInfo::getBrokerUploadUrl () const [virtual]`
- 6.151.2.9 `virtual std::string& activemq::commands::BrokerInfo::getBrokerUploadUrl () [virtual]`
- 6.151.2.10 `virtual const std::string& activemq::commands::BrokerInfo::getBrokerURL () const [virtual]`
- 6.151.2.11 `virtual std::string& activemq::commands::BrokerInfo::getBrokerURL () [virtual]`
- 6.151.2.12 `virtual long long activemq::commands::BrokerInfo::getConnectionId () const [virtual]`
- 6.151.2.13 `virtual unsigned char activemq::commands::BrokerInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

6.151.2.14 `virtual const std::string& activemq::commands::BrokerInfo::getNetworkProperties () const [virtual]`

6.151.2.15 `virtual std::string& activemq::commands::BrokerInfo::getNetworkProperties () [virtual]`

6.151.2.16 `virtual const std::vector< decaf::lang::Pointer<BrokerInfo> >& activemq::commands::BrokerInfo::getPeerBrokerInfos () const [virtual]`

6.151.2.17 `virtual std::vector< decaf::lang::Pointer<BrokerInfo> >& activemq::commands::BrokerInfo::getPeerBrokerInfos () [virtual]`

6.151.2.18 `virtual bool activemq::commands::BrokerInfo::isBrokerInfo () const [inline, virtual]`

Returns

an answer of true to the **isBrokerInfo()** (p. 907) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 767).

-
- 6.151.2.19 `virtual bool activemq::commands::BrokerInfo::isDuplexConnection () const`

[virtual]
-
- Generated on Sat Mar 26 2011 07:19:23 for activemq-cpp-3.2.5 by Doxygen
- 6.151.2.36 `virtual std::string activemq::commands::BrokerInfo::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

6.151.2.37 `virtual Pointer<Command> activemq::commands::BrokerInfo::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

6.152.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerInfoMarshaller** (p.910). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.152.2 Constructor & Destructor Documentation

6.152.2.1 `activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::BrokerInfoMarshaller () [inline]`

6.152.2.2 `virtual activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::~~BrokerInfoMarshaller () [inline, virtual]`

6.152.3 Member Function Documentation

6.152.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.152.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.152.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

6.152.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

6.152.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

```
6.152.3.6 virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

```
6.152.3.7 virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 777).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**BrokerInfoMarshaller.h**

6.153 activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **BrokerInfoMarshaller** (p. 915).

6.153.2.1 **activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::BrokerInfoMarshaller**
() [inline]

6.153.2.2 **virtual activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::~~BrokerInfoMarshaller**
() [inline, virtual]

6.153.3 Member Function Documentation

6.153.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.153.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::getDataStructureType**
() **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.153.3.3 **virtual void activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) **throw** (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

6.153.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

6.153.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 782).

```
6.153.3.6 virtual void activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 783).

```
6.153.3.7 virtual void activemq::wireformat::openwire::marshal::v4::BrokerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.154.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::getDataStructureType**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.154.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 787).

6.154.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 788).

```
6.154.3.5 virtual int activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```
6.154.3.6 virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

6.155 activemq::wireformat::openwire::marshal::v5::BrokerInfoMarshaller

Class Reference

923

6.154.3.7 virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

6.155.3 Member Function Documentation

6.155.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::BrokerInfoMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.155.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::BrokerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.155.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::BrokerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

6.155.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

```
6.155.3.5  virtual int activemq::wireformat::openwire::marshal::v5::BrokerInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 796).

```
6.155.3.6  virtual void activemq::wireformat::openwire::marshal::v5::BrokerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

6.156 activemq::wireformat::openwire::marshal::v6::BrokerInfoMarshaller

Class Reference

927

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.

- int **_mark**
- bool **_markSet**

6.158.1 Detailed Description

A container for data of a specific primitive type. A buffer is a linear, finite sequence of elements of a specific primitive type. Aside from its content, the essential properties of a buffer are its capacity, limit, and position:

A buffer's capacity is the number of elements it contains. The capacity of a buffer is never negative and never changes.

A buffer's limit is the index of the first element that should not be read or written. A buffer's limit is never negative and is never greater than its capacity.

A buffer's position is the index of the next element to be read or written. A buffer's position is never negative and is never greater than its limit.

There is one subclass of this class for each non-boolean primitive type.

Transferring data: Each subclass of this class defines two categories of get and put operations: * Relative operations read or write one or more elements starting at the current position and then increment the position by the number of elements transferred. If the requested transfer exceeds the limit then a relative get operation throws a **BufferUnderflowException** (p. 967) and a relative put operation throws a **BufferOverflowException** (p. 964); in either case, no data is transferred. * Absolute operations take an explicit element index and do not affect the position. Absolute get and put operations throw an **IndexOutOfBoundsException** if the index argument exceeds the limit.

Data may also, of course, be transferred in to or out of a buffer by the I/O operations of an appropriate channel, which are always relative to the current position.

Marking and resetting:

A buffer's mark is the index to which its position will be reset when the reset method is invoked. The mark is not always defined, but when it is defined it is never negative and is never greater than the position. If the mark is defined then it is discarded when the position or the limit is adjusted to a value smaller than the mark. If the mark is not defined then invoking the reset method causes an **InvalidMarkException** (p. 2204) to be thrown.

Invariants:

The following invariant holds for the mark, position, limit, and capacity values: $0 \leq \text{mark} \leq \text{position} \leq \text{limit} \leq \text{capacity}$

A newly-created buffer always has a position of zero and a mark that is undefined. The initial limit may be zero, or it may be some other value that depends upon the type of the buffer and the manner in which it is constructed. The initial content of a buffer is, in general, undefined.

Clearing, flipping, and rewinding:

In addition to methods for accessing the position, limit, and capacity values and for marking and resetting, this class also defines the following operations upon buffers:

clear() (p. 939) makes a buffer ready for a new sequence of channel-read or relative put operations: It sets the limit to the capacity and the position to zero.

flip() (p. 939) makes a buffer ready for a new sequence of channel-write or relative get operations: It sets the limit to the current position and then sets the position to zero.

rewind() (p. 942) makes a buffer ready for re-reading the data that it already contains: It leaves the limit unchanged and sets the position to zero.

Read-only buffers:

Every buffer is readable, but not every buffer is writable. The mutation methods of each buffer class are specified as optional operations that will throw a **ReadOnlyBufferException** (p. 3260) when invoked upon a read-only buffer. A read-only buffer does not allow its content to be changed, but its mark, position, and limit values are mutable. Whether or not a buffer is read-only may be determined by invoking its `isReadOnly` method.

Thread safety:

Buffers are not safe for use by multiple concurrent threads. If a buffer is to be used by more than one thread then access to the buffer should be controlled by appropriate synchronization.

Invocation chaining:

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained; for example, the sequence of statements

```
b.flip(); b.position(23); b.limit(42);
```

can be replaced by the single, more compact statement `b.flip().position(23).limit(42);`

6.158.2 Constructor & Destructor Documentation

6.158.2.1 `decaf::nio::Buffer::Buffer (int capacity)`

6.158.2.2 `decaf::nio::Buffer::Buffer (const Buffer & other)`

6.158.2.3 `virtual decaf::nio::Buffer::~Buffer ()` [`inline`, `virtual`]

6.158.3 Member Function Documentation

6.158.3.1 `virtual int decaf::nio::Buffer::capacity () const` [`inline`, `virtual`]

Returns

this buffer's capacity.

6.158.3.2 `virtual Buffer& decaf::nio::Buffer::clear ()` [`virtual`]

Clears this buffer.

The position is set to zero, the limit is set to the capacity, and the mark is discarded.

Invoke this method before using a sequence of channel-read or put operations to fill this buffer. For example:

```
buf.clear(); // Prepare buffer for reading in.read(buf); // Read data
```

This method does not actually erase the data in the buffer, but it is named as if it did because it will most often be used in situations in which that might as well be the case.

Returns

a reference to this buffer.

6.158.3.3 `virtual Buffer& decaf::nio::Buffer::flip ()` [`virtual`]

Flips this buffer.

The limit is set to the current position and then the position is set to zero. If the mark is defined then it is discarded.

After a sequence of channel-read or put operations, invoke this method to prepare for a sequence of channel-write or relative get operations. For example:

```
buf.put(magic); // Prepend header in.read(buf); // Read data into rest of buffer buf.flip();  
// Flip buffer out.write(buf); // Write header + data to channel
```

This method is often used in conjunction with the compact method when transferring data from one place to another.

Returns

a reference to this buffer.

6.158.3.4 `virtual bool decaf::nio::Buffer::hasRemaining () const` `[inline, virtual]`

Tells whether there are any elements between the current position and the limit.

Returns

true if, and only if, there is at least one element remaining in this buffer.

6.158.3.5 `virtual bool decaf::nio::Buffer::isReadOnly () const` `[pure virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implemented in `decaf::internal::nio::ByteBuffer` (p. 1030), `decaf::internal::nio::CharArrayBuffer` (p. 1145), `decaf::internal::nio::DoubleArrayBuffer` (p. 1863), `decaf::internal::nio::FloatArrayBuffer` (p. 1983), `decaf::internal::nio::IntArrayBuffer` (p. 2128), `decaf::internal::nio::LongArrayBuffer` (p. 2520), `decaf::internal::nio::ShortArrayBuffer` (p. 3558), and `decaf::nio::ByteBuffer` (p. 1068).

6.158.3.6 `virtual int decaf::nio::Buffer::limit () const` `[inline, virtual]`

Returns

this buffers Limit

6.158.3.7 `virtual Buffer& decaf::nio::Buffer::limit (int newLimit) throw (lang::exceptions::IllegalArgumentException)` `[virtual]`

Sets this buffer's limit.

If the position is larger than the new limit then it is set to the new limit. If the mark is defined and larger than the new limit then it is discarded.

Parameters

<i>newLimit</i>	The new limit value; must be no larger than this buffer's capacity.
-----------------	---

Returns

A reference to This buffer

Exceptions

<i>IllegalArgumentEx- ception</i>	if preconditions on the new pos don't hold.
---------------------------------------	---

6.158.3.8 virtual Buffer& decaf::nio::Buffer::mark () [virtual]

Sets this buffer's mark at its position.

Returns

a reference to this buffer.

6.158.3.9 virtual int decaf::nio::Buffer::position () const [inline, virtual]**Returns**

the current position in the buffer

6.158.3.10 virtual Buffer& decaf::nio::Buffer::position (int *newPosition*) throw (lang::exceptions::IllegalArgumentException) [virtual]

Sets this buffer's position.

If the mark is defined and larger than the new position then it is discarded.

Parameters

<i>newPosition</i>	The new postion in the buffer to set.
--------------------	---------------------------------------

Returns

a reference to This buffer.

Exceptions

<i>IllegalArgumentEx- ception</i>	if preconditions on the new pos don't hold.
---------------------------------------	---

6.158.3.11 virtual int decaf::nio::Buffer::remaining () const [inline, virtual]

Returns the number of elements between the current position and the limit.

Returns

The number of elements remaining in this buffer

6.158.3.12 `virtual Buffer& decaf::nio::Buffer::reset () throw (InvalidMarkException)`
`[virtual]`

Resets this buffer's position to the previously-marked position.

Returns

a reference to this buffer.

Exceptions

<i>InvalidMarkException</i> (p. 2204)	- If the mark has not been set
---	--------------------------------

6.158.3.13 `virtual Buffer& decaf::nio::Buffer::rewind ()` `[virtual]`

Rewinds this buffer.

The position is set to zero and the mark is discarded.

Invoke this method before a sequence of channel-write or get operations, assuming that the limit has already been set appropriately. For example:

```
out.write(buf); // Write remaining data buf.rewind(); // Rewind buffer buf.get(array); //
Copy data into array
```

Returns

a reference to this buffer.

6.158.4 Field Documentation

6.158.4.2 `int decaf::nio::Buffer::_limit` `[protected]`

6.158.4.3 `int decaf::nio::Buffer::_mark` `[protected]`

6.158.4.4 `bool decaf::nio::Buffer::_markSet` `[protected]`

6.158.4.5 `int decaf::nio::Buffer::_position` `[mutable, protected]`

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/Buffer.h`

6.159 decaf::io::BufferedInputStream Class Reference

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

```
#include <src/main/decaf/io/BufferedInputStream.h>
```

Inheritance diagram for decaf::io::BufferedInputStream:

Public Member Functions

- **BufferedInputStream** (**InputStream** *stream, bool own=false)

Constructor.

- **BufferedInputStream** (**InputStream** *stream, int bufferSize, bool own=false)
throw (lang::exceptions::IllegalArgumentException)

Constructor.

- virtual ~**BufferedInputStream** ()
- virtual int **available** () const throw (decaf::io::IOException)

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute. The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual void **close** () throw (decaf::io::IOException)

*Closes the **InputStream** (p. 2105) freeing any resources that might have been aquired during the lifetime of this stream.*

The default implementation of this method does nothing.

- virtual long long **skip** (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

*The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached.*

Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	<i>The number of bytes to skip.</i>
-----	-------------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
UnsupportedOperationException	<i>if the concrete stream class does not support skipping bytes.</i>

- virtual void **mark** (int readLimit)

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	<i>The max bytes read before marked position is invalid.</i>
-----------	--

- virtual void **reset** () throw (decaf::io::IOException)

Repositions this stream to the position at the time the mark method was last called on this input stream.

*If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2210) might be thrown. * If such an **IOException** (p. 2210) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

*If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2210). * If an **IOException** (p. 2210) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

*The default implementation of this method throws an **IOException** (p. 2210).*

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** () throw (decaf::io::IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

6.159.1 Detailed Description

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

6.159.2 Constructor & Destructor Documentation

6.159.2.1 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * *stream*, bool *own* = false)

Constructor.

Parameters

<i>stream</i>	The target input stream to buffer.
<i>own</i>	Indicates if we own the stream object, defaults to false.

6.159.2.2 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * *stream*, int *bufferSize*, bool *own* = false) throw (lang::exceptions::IllegalArgumentException)

Constructor.

Parameters

<i>stream</i>	The target input stream to buffer.
<i>bufferSize</i>	The size in bytes to allocate for the internal buffer.
<i>own</i>	Indicates if we own the stream object, defaults to false.

Exceptions

<i>IllegalArgumentException</i>	is the size is zero or negative.
---------------------------------	----------------------------------

6.159.2.3 `virtual decaf::io::BufferedInputStream::~BufferedInputStream ()` [virtual]

6.159.3 Member Function Documentation

6.159.3.1 `virtual int decaf::io::BufferedInputStream::available () const throw (decaf::io::IOException)` [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error occurs.
--	-------------------------

Reimplemented from `decaf::io::FilterInputStream` (p. 1953).

6.159.3.2 `virtual void decaf::io::BufferedInputStream::close () throw (decaf::io::IOException)` [virtual]

Closes the **InputStream** (p. 2105) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Reimplemented from `decaf::io::FilterInputStream` (p. 1954).

6.159.3.3 `virtual int decaf::io::BufferedInputStream::doReadArrayBounded (unsigned char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)` [protected, virtual]

Reimplemented from `decaf::io::FilterInputStream` (p. 1954).

6.159.3.4 `virtual int decaf::io::BufferedInputStream::doReadByte () throw (decaf::io::IOException)` [protected, virtual]

Reimplemented from `decaf::io::FilterInputStream` (p. 1954).

6.159.3.5 virtual void decaf::io::BufferedInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

<i>readLimit</i>	The max bytes read before marked position is invalid.
------------------	---

Reimplemented from **decaf::io::FilterInputStream** (p. 1955).

6.159.3.6 virtual bool decaf::io::BufferedInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1955).

6.159.3.7 virtual void decaf::io::BufferedInputStream::reset () throw (decaf::io::IOException) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2210) might be thrown. * If such an **IOException** (p. 2210) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2210). * If an **IOException** (p. 2210) is not thrown, then the stream

is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 2210).

Exceptions

IOException (p. 2210)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::FilterInputStream** (p. 1956).

```
6.159.3.8 virtual long long decaf::io::BufferedInputStream::skip
( long long num ) throw ( decaf::io::IOException,
decaf::lang::exceptions::UnsupportedOperationException )
[virtual]
```

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 2210)	if an I/O error occurs.
<i>UnsupportedOperationException</i>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::FilterInputStream** (p. 1956).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**BufferedInputStream.h**

6.160 decaf::io::BufferedOutputStream Class Reference

6.161 decaf::internal::nio::BufferFactory Class Reference

Factory class used by static methods in the **decaf::nio** (p. 147) package to create the various default version of the NIO interfaces.

```
#include <src/main/decaf/internal/nio/BufferFactory.h>
```

Public Member Functions

- virtual ~**BufferFactory** ()

Static Public Member Functions

- static **decaf::nio::ByteBuffer** * **createByteBuffer** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::ByteBuffer** * **createByteBuffer** (unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Wraps the passed buffer with a new ByteBuffer.

- static **decaf::nio::ByteBuffer** * **createByteBuffer** (std::vector< unsigned char > &buffer)

Wraps the passed STL Byte Vector in a ByteBuffer.

- static **decaf::nio::CharBuffer** * **createCharBuffer** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allocates a new char buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::CharBuffer** * **createCharBuffer** (char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Wraps the passed buffer with a new CharBuffer.

- static **decaf::nio::CharBuffer * createCharBuffer** (std::vector< char > &buffer)

Wraps the passed STL Byte Vector in a CharBuffer.

- static **decaf::nio::DoubleBuffer * createDoubleBuffer** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allocates a new double buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::DoubleBuffer * createDoubleBuffer** (double *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Wraps the passed buffer with a new DoubleBuffer.

- static **decaf::nio::DoubleBuffer * createDoubleBuffer** (std::vector< double > &buffer)

Wraps the passed STL Double Vector in a DoubleBuffer.

- static **decaf::nio::FloatBuffer * createFloatBuffer** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allocates a new float buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::FloatBuffer * createFloatBuffer** (float *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Wraps the passed buffer with a new FloatBuffer.

- static **decaf::nio::FloatBuffer * createFloatBuffer** (std::vector< float > &buffer)

Wraps the passed STL Float Vector in a FloatBuffer.

- static **decaf::nio::LongBuffer * createLongBuffer** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allocates a new long long buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::LongBuffer * createLongBuffer** (long long *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Wraps the passed buffer with a new LongBuffer.

- static **decaf::nio::LongBuffer * createLongBuffer** (std::vector< long long > &buffer)

Wraps the passed STL Long Vector in a LongBuffer.

- static **decaf::nio::IntBuffer * createIntBuffer** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::IntBuffer * createIntBuffer** (int *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Wraps the passed buffer with a new IntBuffer.

- static **decaf::nio::IntBuffer * createIntBuffer** (std::vector< int > &buffer)

Wraps the passed STL int Vector in a IntBuffer.

- static **decaf::nio::ShortBuffer * createShortBuffer** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::ShortBuffer * createShortBuffer** (short *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Wraps the passed buffer with a new ShortBuffer.

- static **decaf::nio::ShortBuffer * createShortBuffer** (std::vector< short > &buffer)

Wraps the passed STL Short Vector in a ShortBuffer.

6.161.1 Detailed Description

Factory class used by static methods in the **decaf::nio** (p. 147) package to create the various default version of the NIO interfaces.

Since

1.0

6.161.2 Constructor & Destructor Documentation

6.161.2.1 `virtual decaf::internal::nio::BufferFactory::~BufferFactory () [inline, virtual]`

6.161.3 Member Function Documentation

6.161.3.1 `static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [static]`

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated ByteBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.161.3.2 `static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (unsigned char * buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]`

Wraps the passed buffer with a new ByteBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new ByteBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given is Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.161.3.3 static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (std::vector< unsigned char > & buffer) [static]

Wraps the passed STL Byte Vector in a ByteBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new ByteBuffer that is backed by buffer, caller owns.

6.161.3.4 static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [static]

Allocates a new char buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated CharBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.161.3.5 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (char * buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]`

Wraps the passed buffer with a new CharBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new CharBuffer that is backed by `buffer`, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.161.3.6 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (std::vector< char > & buffer) [static]`

Wraps the passed STL Byte Vector in a CharBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new CharBuffer that is backed by `buffer`, caller owns.

6.161.3.7 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (double * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]

Wraps the passed buffer with a new DoubleBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new DoubleBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.161.3.8 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (std::vector< double > & *buffer*) [static]

Wraps the passed STL Double Vector in a DoubleBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new DoubleBuffer that is backed by buffer, caller owns.

6.161.3.9 `static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[static]

Allocates a new double buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated DoubleBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.161.3.10 `static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[static]

Allocates a new float buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated FloatBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.161.3.11 `static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (float * buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)` [static]

Wraps the passed buffer with a new FloatBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new FloatBuffer that is backed by `buffer`, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given is Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.161.3.12 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (std::vector< float > & buffer) [static]

Wraps the passed STL Float Vector in a FloatBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new FloatBuffer that is backed by `buffer`, caller owns.

6.161.3.13 `static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (int capacity)
throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[static]`

Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated IntBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.161.3.14 `static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (std::vector< int > & buffer) [static]`

Wraps the passed STL int Vector in a IntBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new IntBuffer that is backed by `buffer`, caller owns.

6.161.3.15 `static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (int * buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]`

Wraps the passed buffer with a new IntBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its

mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new IntBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.161.3.16 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (std::vector< long long > & buffer) [static]

Wraps the passed STL Long Vector in a LongBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new LongBuffer that is backed by buffer, caller owns.

6.161.3.17 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [static]

Allocates a new long long buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	- the internal buffer's capacity.
-----------------	-----------------------------------

Returns

a newly allocated DoubleBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.161.3.18 `static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (long long * buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)` [static]

Wraps the passed buffer with a new LongBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new LongBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.161.3.19 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (int *capacity*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [static]

Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated ShortBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.161.3.20 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (short * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]

Wraps the passed buffer with a new ShortBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new ShortBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.161.3.21 `static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (std::vector< short > & buffer) [static]`

Wraps the passed STL Short Vector in a ShortBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new `DoubleBuffer` that is backed by `buffer`, caller owns.

6.162.1 Constructor & Destructor Documentation

6.162.1.1 decaf::nio::BufferOverflowException::BufferOverflowException () throw ()
[inline]

Default Constructor.

6.162.1.2 decaf::nio::BufferOverflowException::BufferOverflowException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.162.1.3 decaf::nio::BufferOverflowException::BufferOverflowException (const BufferOverflowException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.162.1.4 decaf::nio::BufferOverflowException::BufferOverflowException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.162.1.5 `decaf::nio::BufferOverflowException::BufferOverflowException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.162.1.6 `decaf::nio::BufferOverflowException::BufferOverflowException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.162.1.7 `virtual decaf::nio::BufferOverflowException::~~BufferOverflowException () throw () [inline, virtual]`

6.162.2 Member Function Documentation

6.162.2.1 `virtual BufferOverflowException* decaf::nio::BufferOverflowException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::Exception** (p. 1889).

*Decodes a **String** (p. 3775) into a **Byte** (p. 969).*

- static unsigned char **parseByte** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed unsigned char in the radix specified by the second argument.
- static unsigned char **parseByte** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal unsigned char.
- static **Byte valueOf** (unsigned char value)
*Returns a **Character** (p. 1126) instance representing the specified char value.*
- static **Byte valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Byte** (p. 969) object holding the value given by the specified std::string.*
- static **Byte valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Byte** (p. 969) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const unsigned char **MIN_VALUE** = 0x7F
The minimum value that a unsigned char can take on.
- static const unsigned char **MAX_VALUE** = 0x80
The maximum value that a unsigned char can take on.
- static const int **SIZE** = 8
The size of the primitive charactor in bits.

6.164.1 Constructor & Destructor Documentation

6.164.1.1 decaf::lang::Byte::Byte (unsigned char value)

Parameters

<i>value</i>	- the primitive value to wrap
--------------	-------------------------------

6.164.1.2 `decaf::lang::Byte::Byte (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters

<i>value</i>	- the string to convert to an unsigned char
--------------	---

Exceptions

<i>NumberFormatException</i>	
------------------------------	--

6.164.1.3 `virtual decaf::lang::Byte::~Byte () [inline, virtual]`

6.164.2 Member Function Documentation

6.164.2.1 `virtual unsigned char decaf::lang::Byte::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2919).

6.164.2.2 `virtual int decaf::lang::Byte::compareTo (const unsigned char & c) const [inline, virtual]`

Compares this **Byte** (p. 969) instance with a char type.

Parameters

<i>c</i>	- the char instance to be compared
----------	------------------------------------

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< unsigned char >** (p. 1249).

6.164.2.3 `virtual int decaf::lang::Byte::compareTo (const Byte & c) const [inline, virtual]`

Compares this **Byte** (p. 969) instance with another.

Parameters

<i>c</i>	- the Byte (p. 969) instance to be compared
----------	--

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Byte** > (p. 1249).

6.164.2.4 static **Byte** decaf::lang::Byte::decode (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Decodes a **String** (p. 3775) into a **Byte** (p. 969).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Byte::parseByte** (p. 976) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a **NumberFormatException** will be thrown. The result is negated if first character of the specified **String** (p. 3775) is the minus sign. No whitespace characters are permitted in the string.

Parameters

<i>value</i>	- The string to decode
--------------	------------------------

Returns

a **Byte** (p. 969) object containing the decoded value

Exceptions

<i>NumberFormatException</i>	if the string is not formatted correctly.
------------------------------	---

6.164.2.5 virtual double decaf::lang::Byte::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2919).

6.164.2.6 `bool decaf::lang::Byte::equals (const unsigned char & c) const` `[inline, virtual]`

Returns

true if the two Bytes have the same value.

Implements **decaf::lang::Comparable**< unsigned char > (p. 1250).

6.164.2.7 `bool decaf::lang::Byte::equals (const Byte & c) const` `[inline, virtual]`

Returns

true if the two **Byte** (p. 969) Objects have the same value.

Implements **decaf::lang::Comparable**< Byte > (p. 1250).

6.164.2.8 `virtual float decaf::lang::Byte::floatValue () const` `[inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.164.2.9 `virtual int decaf::lang::Byte::intValue () const` `[inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.164.2.10 `virtual long long decaf::lang::Byte::longValue () const` `[inline, virtual]`

Answers the long value which the receiver represents.

Returns

long long the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.164.2.11 `virtual bool decaf::lang::Byte::operator< (const unsigned char & c) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< unsigned char >** (p. 1250).

6.164.2.12 `virtual bool decaf::lang::Byte::operator< (const Byte & c) const` [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Byte >** (p. 1250).

6.164.2.13 `virtual bool decaf::lang::Byte::operator== (const Byte & c) const` [inline, virtual]

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Byte >** (p. 1250).

6.164.2.14 `virtual bool decaf::lang::Byte::operator== (const unsigned char & c) const`
`[inline, virtual]`

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< unsigned char >` (p. 1250).

6.164.2.15 `static unsigned char decaf::lang::Byte::parseByte (const std::string & s) throw (`
`exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal unsigned char.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting unsigned char value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseByte(const std::string, int)` method.

Parameters

<code>s</code>	- String (p. 3775) to convert to a unsigned char
----------------	---

Returns

the converted unsigned char value

Exceptions

<i>NumberFormatException</i>	if the string is not a unsigned char.
------------------------------	---------------------------------------

6.164.2.16 `static unsigned char decaf::lang::Byte::parseByte (const std::string & s, int radix)`
`throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed unsigned char in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 1130) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type `NumberFormatException` is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is ei-

ther smaller than **Character::MIN_RADIX** (p. 1134) or larger than **Character::MAX_RADIX** (p. 1134). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type unsigned char.

Parameters

<i>s</i>	- the String (p. 3775) containing the unsigned char to be parsed
<i>radix</i>	- the radix to be used while parsing s

Returns

the unsigned char represented by the string argument in the specified radix.

Exceptions

<i>NumberFormatException</i>	- If String (p. 3775) does not contain a parsable unsigned char.
------------------------------	---

6.164.2.17 virtual short decaf::lang::Byte::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2920).

6.164.2.18 static std::string decaf::lang::Byte::toString (unsigned char value) [static]

Returns

a string representing the primitive value as Base 10

6.164.2.19 std::string decaf::lang::Byte::toString () const

Returns

this **Byte** (p. 969) Object as a **String** (p. 3775) Representation

6.164.2.20 static Byte decaf::lang::Byte::valueOf (unsigned char value) [inline, static]

Returns a **Character** (p. 1126) instance representing the specified char value.

Parameters

<i>value</i>	- the primitive char to wrap.
--------------	-------------------------------

Returns

a new **Character** (p. 1126) instance that wraps this value.

6.164.2.21 `static Byte decaf::lang::Byte::valueOf (const std::string & value, int radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Byte** (p. 969) object holding the value extracted from the specified `std::string` when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed unsigned char in the radix specified by the second argument, exactly as if the argument were given to the `parseByte(std::string, int)` method. The result is a **Byte** (p. 969) object that represents the unsigned char value specified by the string.

Parameters

<i>value</i>	- <code>std::string</code> to parse as base (<i>radix</i>)
<i>radix</i>	- base of the string to parse.

Returns

new **Byte** (p. 969) Object wrapping the primitive

Exceptions

<i>NumberFormatException</i>	if the string is not a valid unsigned char.
------------------------------	---

6.164.2.22 `static Byte decaf::lang::Byte::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]`

Returns a **Byte** (p. 969) object holding the value given by the specified `std::string`.

The argument is interpreted as representing a signed decimal unsigned char, exactly as if the argument were given to the `parseByte(std::string)` method. The result is a **Byte** (p. 969) object that represents the unsigned char value specified by the string.

Parameters

<i>value</i>	- <code>std::string</code> to parse as base 10
--------------	--

Returns

new **Byte** (p. 969) Object wrapping the primitive

Exceptions

<i>NumberFormatException</i>	if the string is not a decimal unsigned char.
------------------------------	---

6.164.3 Field Documentation

6.164.3.1 `const unsigned char decaf::lang::Byte::MAX_VALUE = 0x80` [static]

The maximum value that a unsigned char can take on.

6.164.3.2 `const unsigned char decaf::lang::Byte::MIN_VALUE = 0x7F` [static]

The minimum value that a unsigned char can take on.

6.164.3.3 `const int decaf::lang::Byte::SIZE = 8` [static]

The size of the primitive charactor in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Byte.h`

6.165 decaf::internal::util::ByteArrayAdapter Class Reference

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

```
#include <src/main/decaf/internal/util/ByteArrayAdapter.h>
```

Data Structures

- union **Array**

Public Member Functions

- **ByteArrayAdapter** (int size) throw (decaf::lang::exceptions::IllegalArgumentException)
Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.
- **ByteArrayAdapter** (unsigned char *array, int size, bool own=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte array object that wraps the given array.

- **ByteArrayAdapter** (char *array, int size, bool own=false) throw (decaf::lang::exceptions::NullPointerException
decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (double *array, int size, bool own=false) throw (decaf::lang::exceptions::NullPointerException
decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (float *array, int size, bool own=false) throw (decaf::lang::exceptions::NullPointerException
decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (long long *array, int size, bool own=false) throw (de-
caf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException
)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (int *array, int size, bool own=false) throw (decaf::lang::exceptions::NullPointerException
decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (short *array, int size, bool own=false) throw (decaf::lang::exceptions::NullPointerException
decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte array object that wraps the given array.
- virtual ~**ByteArrayAdapter** ()
- virtual int **getCapacity** () const
Gets the size of the underlying array.
- virtual int **getCharCapacity** () const
Gets the size of the underlying array as if it contains chars.
- virtual int **getDoubleCapacity** () const
Gets the size of the underlying array as if it contains doubles.
- virtual int **getFloatCapacity** () const
Gets the size of the underlying array as if it contains doubles.
- virtual int **getLongCapacity** () const
Gets the size of the underlying array as if it contains doubles.
- virtual int **getIntCapacity** () const
Gets the size of the underlying array as if it contains ints.
- virtual int **getShortCapacity** () const
Gets the size of the underlying array as if it contains shorts.

- virtual unsigned char * **getByteArray** ()
Gets the pointer to the array we are wrapping.
- virtual char * **getCharArray** ()
Gets the pointer to the array we are wrapping.
- virtual short * **getShortArray** ()
Gets the pointer to the array we are wrapping.
- virtual int * **getIntArray** ()
Gets the pointer to the array we are wrapping.
- virtual long long * **getLongArray** ()
Gets the pointer to the array we are wrapping.
- virtual double * **getDoubleArray** ()
Gets the pointer to the array we are wrapping.
- virtual float * **getFloatArray** ()
Gets the pointer to the array we are wrapping.
- virtual void **read** (unsigned char *buffer, int size, int offset, int length) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException, decaf::nio::BufferUnderflowException)
Reads from the Byte array starting at the specified offset and reading the specified length.
- virtual void **write** (unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException, decaf::nio::BufferOverflowException)
Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects internal array.
- virtual void **resize** (int size) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::InvalidStateException)
Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.
- virtual void **clear** () throw ()
Clear all data from that Array, setting the underlying bytes to zero.
- unsigned char & **operator** [] (int index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Allows the **ByteArrayAdapter** (p. 979) to be indexed as a standard array.*

- const unsigned char & **operator[]** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual unsigned char **get** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual char **getChar** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads one byte at the given index and returns it.
- virtual double **getDouble** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual double **getDoubleAt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given byte index and returns it.
- virtual float **getFloat** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual float **getFloatAt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given byte index and returns it.
- virtual long long **getLong** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual long long **getLongAt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given byte index and returns it.
- virtual int **getInt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual int **getIntAt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given byte index and returns it.
- virtual short **getShort** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads two bytes at the given index and returns it.

- virtual short **getShortAt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads two bytes at the given byte index and returns it.
- virtual **ByteArrayAdapter** & **put** (int index, unsigned char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes the given byte into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putChar** (int index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes one byte containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putDouble** (int index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putDoubleAt** (int index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putFloat** (int index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putFloatAt** (int index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putLong** (int index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putLongAt** (int index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putInt** (int index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putIntAt** (int index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putShort** (int index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putShortAt** (int index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Writes two bytes containing the given value, into this buffer at the given byte index.

6.165.1 Detailed Description

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data. All the array types are mapped down to a byte array and methods are supplied for accessing the data in any of the primitive type forms.

Methods in this class that do not return a specific value return a reference to this object so that calls can be chained.

Since

1.0

6.165.2 Constructor & Destructor Documentation

6.165.2.1 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int *size*) throw (decaf::lang::exceptions::IllegalArgumentException)

Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>size</i>	The size of the array, this is the limit we read and write to.
-------------	--

Exceptions

<i>IllegalArgumentException</i>	if size is negative.
---------------------------------	----------------------

6.165.2.2 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (unsigned char * *array*, int *size*, bool *own* = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.165.2.3 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (char * array, int size, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.165.2.4 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (double * array, int size, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.165.2.5 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (float * array, int size, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.165.2.6 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (long long * array, int size, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.165.2.7 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int * array, int size, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.165.2.8 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (short * array, int size, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.165.2.9 `virtual decaf::internal::util::ByteArrayAdapter::~~ByteArrayAdapter ()`
[virtual]

6.165.3 Member Function Documentation

6.165.3.1 `virtual void decaf::internal::util::ByteArrayAdapter::clear () throw ()` [virtual]

Clear all data from that Array, setting the underlying bytes to zero.

6.165.3.2 `virtual unsigned char decaf::internal::util::ByteArrayAdapter::get (int index)`
`const throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

<i>index</i>	The index in the Buffer where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	If index is not smaller than the buffer's limit or is negative.
----------------------------------	---

6.165.3.3 `virtual unsigned char* decaf::internal::util::ByteArrayAdapter::getByteArray ()`
[inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 979) objects that point to this array.

Returns

an unsigned char* pointer to the array this object wraps.

6.165.3.4 `virtual int decaf::internal::util::ByteArrayAdapter::getCapacity () const`
[inline, virtual]

Gets the size of the underlying array.

Returns

the size the array.

6.165.3.5 `virtual char decaf::internal::util::ByteArrayAdapter::getChar (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Reads one byte at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	If index is not smaller than the buffer's limit or is negative.
----------------------------------	---

6.165.3.6 `virtual char* decaf::internal::util::ByteArrayAdapter::getCharArray ()` [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 979) objects that point to this array.

Returns

an char* pointer to the array this object wraps.

6.165.3.7 `virtual int decaf::internal::util::ByteArrayAdapter::getCharCapacity () const` [inline, virtual]

Gets the size of the underlying array as if it contains chars.

Returns

the size the array.

6.165.3.8 `virtual double decaf::internal::util::ByteArrayAdapter::getDouble (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Reads eight bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.9 `virtual double* decaf::internal::util::ByteArrayAdapter::getDoubleArray ()`
`[inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 979) objects that point to this array.

Returns

an double* pointer to the array this object wraps.

6.165.3.10 `virtual double decaf::internal::util::ByteArrayAdapter::getDoubleAt (int index)`
`const throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
`[virtual]`

Reads eight bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.11 `virtual int decaf::internal::util::ByteArrayAdapter::getDoubleCapacity () const`
`[inline, virtual]`

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.165.3.12 `virtual float decaf::internal::util::ByteArrayAdapter::getFloat (int index) const
throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Reads four bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.13 `virtual float* decaf::internal::util::ByteArrayAdapter::getFloatArray ()
[inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 979) objects that point to this array.

Returns

an float* pointer to the array this object wraps.

6.165.3.14 `virtual float decaf::internal::util::ByteArrayAdapter::getFloatAt (int index)
const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Reads four bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.15 `virtual int decaf::internal::util::ByteArrayAdapter::getFloatCapacity () const`
`[inline, virtual]`

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.165.3.16 `virtual int decaf::internal::util::ByteArrayAdapter::getInt (int index) const throw (`
`decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Reads four bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.17 `virtual int* decaf::internal::util::ByteArrayAdapter::getIntArray () [inline,`
`virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 979) objects that point to this array.

Returns

an int* pointer to the array this object wraps.

6.165.3.18 `virtual int decaf::internal::util::ByteArrayAdapter::getIntAt (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Reads four bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.19 `virtual int decaf::internal::util::ByteArrayAdapter::getIntCapacity () const` [inline, virtual]

Gets the size of the underlying array as if it contains ints.

Returns

the size the array.

6.165.3.20 `virtual long long decaf::internal::util::ByteArrayAdapter::getLong (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Reads eight bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.21 `virtual long long* decaf::internal::util::ByteArrayAdapter::getLongArray ()`
`[inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 979) objects that point to this array.

Returns

an long long* pointer to the array this object wraps.

6.165.3.22 `virtual long long decaf::internal::util::ByteArrayAdapter::getLongAt (int index)`
`const throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
`[virtual]`

Reads eight bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.23 `virtual int decaf::internal::util::ByteArrayAdapter::getLongCapacity () const`
`[inline, virtual]`

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.165.3.24 `virtual short decaf::internal::util::ByteArrayAdapter::getShort (int index) const
throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Reads two bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.25 `virtual short* decaf::internal::util::ByteArrayAdapter::getShortArray ()
[inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 979) objects that point to this array.

Returns

an short* pointer to the array this object wraps.

6.165.3.26 `virtual short decaf::internal::util::ByteArrayAdapter::getShortAt (int index)
const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Reads two bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.165.3.27 `virtual int decaf::internal::util::ByteArrayAdapter::getShortCapacity () const`
`[inline, virtual]`

Gets the size of the underlying array as if it contains shorts.

Returns

the size the array.

6.165.3.28 `unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Allows the **ByteArrayAdapter** (p. 979) to be indexed as a standard array.
calling the non constant version allows the user to change the value at index

Parameters

<i>index</i>	The position in the array to access, if the value is negative or greater than the size of the underlying array an <code>IndexOutOfBoundsException</code> is thrown.
--------------	---

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions of index are not met.
----------------------------------	--

6.165.3.29 `const unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int index)`
`const throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

6.165.3.30 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::put`
`(int index, unsigned char value) throw (`
`decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Writes the given byte into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.31 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putChar
(int index, char value) throw (de-
caf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Writes one byte containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.32 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDouble
(int index, double value) throw (de-
caf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Writes eight bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.33 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDoubleAt (int index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.34 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloat (int index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Writes four bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.35 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloatAt (int *index*, float *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.36 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putInt (int *index*, int *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]

Writes four bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.37 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putIntAt
(int index, int value) throw (de-
caf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.38 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLong
(int index, long long value) throw (de-
caf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Writes eight bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.39 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLongAt
(int *index*, long long *value*) throw (de-
caf::lang::exceptions::IndexOutOfBoundsException)
[virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.40 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShort
(int *index*, short *value*) throw (de-
caf::lang::exceptions::IndexOutOfBoundsException)
[virtual]

Writes two bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.41 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShortAt (int index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Writes two bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.165.3.42 `virtual void decaf::internal::util::ByteArrayAdapter::read (unsigned char * buffer, int size, int offset, int length) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException, decaf::nio::BufferUnderflowException)` [virtual]

Reads from the Byte array starting at the specified offset and reading the specified length.

If the length is greater than the size of this underlying byte array then an BufferUnderflowException is thrown.

Parameters

<i>buffer</i>	The buffer to read data from this array into.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The position in this array to start reading from.
<i>length</i>	The amount of data to read from this array.

Exceptions

<i>IndexOutOfBoundsException</i>	if the offset + length exceeds the size.
<i>NullPointerException</i>	if buffer is null
<i>BufferUnderflowException</i>	if there is not enough data to read because the offset or the length is greater than the size of this array.

6.165.3.43 virtual void decaf::internal::util::ByteArrayAdapter::resize (int *size*)
 throw (decaf::lang::exceptions::IllegalArgumentException,
 decaf::lang::exceptions::InvalidStateException) [virtual]

Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.

A **ByteArrayAdapter** (p. 979) can only be resized when it owns the underlying array, if it does not then it will throw an InvalidStateException.

Parameters

<i>size</i>	The new size of the array.
-------------	----------------------------

Exceptions

<i>IllegalArgumentException</i>	if the size parameter is negative.
<i>InvalidStateException</i>	if this object does not own the buffer.

6.165.3.44 virtual void decaf::internal::util::ByteArrayAdapter::write (unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::IndexOutOfBoundsException,
 decaf::lang::exceptions::NullPointerException,
 decaf::nio::BufferOverflowException) [virtual]

Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects internal array.

. If the length is greater than the size of this underlying byte array then an BufferOverflowException is thrown.

Parameters

<i>buffer</i>	The buffer to read data from this array into.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The position in this array to start reading from.
<i>length</i>	The amount of data to read from this array.

Exceptions

<i>IndexOutOfBoundsException</i>	if the offset + length exceeds the size.
<i>NullPointerException</i>	if buffer is null
<i>BufferOverflowException</i>	if the amount of data to be written to this array or the offset given are larger than this array's size.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/util/ByteArrayAdapter.h`

6.166 decaf::internal::nio::ByteBuffer Class Reference

This class defines six categories of operations upon byte buffers:

```
#include <src/main/decaf/internal/nio/ByteBuffer.h>
```

Inheritance diagram for `decaf::internal::nio::ByteBuffer`:

Public Member Functions

- **ByteBuffer** (int capacity, bool readOnly=false) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **ByteBuffer** (p. 1004) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **ByteBuffer** (unsigned char *array, int size, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a **ByteBuffer** (p. 1004) object that wraps the given array.*
- **ByteBuffer** (const decaf::lang::Pointer< **ByteArrayAdapter** > &array, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteArrayAdapter** and start at the given offset.*
- **ByteBuffer** (const **ByteBuffer** &other)
*Create a **ByteBuffer** (p. 1004) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayAdapter** and when changes are made to that data it is reflected in both.*
- virtual ~**ByteBuffer** ()
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
Returns
true if, and only if, this buffer is read-only
- virtual unsigned char * **array** () throw (decaf::nio::ReadOnlyBufferException, decaf::lang::exceptions::UnsupportedOperationException)

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

ReadOnlyBufferException (p. 3260)	<i>if this buffer is backed by an array but is read-only</i>
UnsupportedOperationException	<i>if this buffer is not backed by an accessible array</i>

- virtual int **arrayOffset** () const throw (decaf::nio::ReadOnlyBufferException, decaf::lang::exceptions::UnsupportedOperationException)

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position `p` corresponds to array index `p + arrayOffset()` (p. 1057).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

ReadOnlyBufferException (p. 3260)	<i>if this buffer is backed by an array but is read-only.</i>
UnsupportedOperationException	<i>if this buffer is not backed by an accessible array.</i>

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns `true` then the `array` and `arrayOffset` methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns `true`.

Returns

`true` if, and only if, this buffer is backed by an array and is not read-only.

- virtual decaf::nio::CharBuffer * **asCharBuffer** () const

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new Char **Buffer** (p. 936), which the caller then owns.*

- virtual **decaf::nio::DoubleBuffer * asDoubleBuffer () const**

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new double **Buffer** (p. 936), which the caller then owns.*

- virtual **decaf::nio::FloatBuffer * asFloatBuffer () const**

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new float **Buffer** (p. 936), which the caller then owns.*

- virtual **decaf::nio::IntBuffer * asIntBuffer () const**

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new int **Buffer** (p. 936), which the caller then owns.*

- virtual **decaf::nio::LongBuffer * asLongBuffer () const**

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new long **Buffer** (p. 936), which the caller then owns.*

- virtual **decaf::nio::ShortBuffer * asShortBuffer () const**

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new short **Buffer** (p. 936), which the caller then owns.*

- virtual **ByteBuffer * asReadOnlyBuffer ()** const

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

- virtual **ByteBuffer & compact ()** throw (decaf::nio::ReadOnlyBufferException)

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

*a reference to this **ByteBuffer** (p. 1049).*

Exceptions

ReadOnlyBufferException (p. 3260)	if this buffer is read-only.
---	------------------------------

- virtual **ByteBuffer * duplicate ()**

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new Byte **Buffer** (p. 936) which the caller owns.

- virtual unsigned char **get** () const throw (decaf::nio::BufferUnderflowException)

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

BufferUnderflowException (p. 967)	if the buffer's current position is not smaller than its limit.
---	---

- virtual unsigned char **get** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

Reads the byte at the given index.

Parameters

index	The index in the Buffer (p. 936) where the byte is to be read.
-------	---

Returns

the byte that is located at the given index.

Exceptions

IndexOutOfBoundsException	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

- virtual char **getChar** () throw (decaf::nio::BufferUnderflowException)

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

BufferUnderflowException (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

- virtual char **getChar** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Reads one byte at the given index and returns it.

Parameters

index	The index in the Buffer (p. 936) where the byte is to be read.
-------	---

Returns

the char at the given index in the buffer

Exceptions

IndexOutOfBoundsException	<i>if index is not smaller than the buffer's limit, or index is negative.</i>
---------------------------	---

- virtual double **getDouble** () throw (decaf::nio::BufferUnderflowException)

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer.

Exceptions

BufferUnderflowException (p. 967)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
---	--

- virtual double **getDouble** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Reads eight bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 936) where the bytes are to be read.</i>
-------	--

Returns

the double at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	<i>if index is not smaller than the buffer's limit, or index is negative.</i>
---------------------------	---

- virtual float **getFloat** () throw (decaf::nio::BufferUnderflowException)

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

BufferUnderflowException (p. 967)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
---	--

- virtual float **getFloat** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Reads four bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 936) where the bytes are to be read.</i>
-------	--

Returns

the float at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---------------------------	--

- virtual long long **getLong** () throw (decaf::nio::BufferUnderflowException)

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

BufferUnderflowException (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

- virtual long long **getLong** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Reads eight bytes at the given index and returns it.

Parameters

index	The index in the Buffer (p. 936) where the bytes are to be read.
-------	---

Returns

the long long at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---------------------------	--

- virtual int **getInt** () throw (decaf::nio::BufferUnderflowException)

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

BufferUnderflowException (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

- virtual int **getInt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Reads four bytes at the given index and returns it.

Parameters

index	The index in the Buffer (p. 936) where the bytes are to be read.
-------	---

Returns

the int at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	<i>if there are not enough bytes remaining to fill the requested Data Type, or index is negative.</i>
---------------------------	---

- virtual short **getShort** () throw (decaf::nio::BufferUnderflowException)

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

BufferUnderflowException (p. 967)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
---	--

- virtual short **getShort** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Reads two bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 936) where the bytes are to be read.</i>
-------	--

Returns

the short at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	<i>if there are not enough bytes remaining to fill the requested Data Type, or index is negative.</i>
---------------------------	---

- virtual **ByteBuffer** & **put** (unsigned char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

value	<i>- the byte value to be written.</i>
-------	--

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	<i>if this buffer's current position is not smaller than its limit.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **put** (int index, unsigned char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes the given byte into this buffer at the given index.

Parameters

index	- position in the Buffer (p. 936) to write the data
value	- the byte to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only.

- virtual **ByteBuffer** & **putChar** (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

value	The value to be written.
-------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 3260)	if this buffer is read-only

- virtual **ByteBuffer** & **putChar** (int index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes one byte containing the given value, into this buffer at the given index.

Parameters

index	The position in the Buffer (p. 936) to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only

- virtual **ByteBuffer** & **putDouble** (double value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.
-------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 3260)	if this buffer is read-only

- virtual **ByteBuffer** & **putDouble** (int index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the Buffer (p. 936) to write the data
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only.

- virtual **ByteBuffer** & **putFloat** (float value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer & putFloat** (int index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 936) to write the data</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer & putLong** (long long value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **putLong** (int index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 936) to write the data.</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **putInt** (int value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only</i>

- virtual **ByteBuffer** & **putInt** (int index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 936) to write the data.</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
---------------------------	---

ReadOnlyBufferException (p. 3260)	if this buffer is read-only
---	-----------------------------

- virtual **ByteBuffer** & **putShort** (short value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.
-------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only.

- virtual **ByteBuffer** & **putShort** (int index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the Buffer (p. 936) to write the data
value	The value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only.

- virtual **ByteBuffer** * **slice** () const

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be

read-only if, and only if, this buffer is read-only.

Returns

*the newly create **ByteBuffer** (p. 1049) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

*Sets this **ByteBuffer** (p. 1004) as Read-Only or not Read-Only.*

6.166.1 Detailed Description

This class defines six categories of operations upon byte buffers: 1. Absolute and relative get and put methods that read and write single bytes; 2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer; 4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat**() (p. 1027) float **getFloat**(int index) void **putFloat**(float f) (p. 1034) void **putFloat**(int index, float f) (p. 1033)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The **asFloatBuffer** method, for example, creates an instance of the **FloatBuffer** class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

Since

1.0

6.166.2 Constructor & Destructor Documentation

6.166.2.1 `decaf::internal::nio::ByteBuffer::ByteBuffer (int capacity, bool readOnly = false) throw (decaf::lang::exceptions::IllegalArgumentException)`

Creates a **ByteBuffer** (p. 1004) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size of the array, this is the limit we read and write to.
<i>readOnly</i>	Should this buffer be read-only, default as false

Exceptions

<i>IllegalArgumentEx- ception</i>	if the capacity value is negative.
---------------------------------------	------------------------------------

6.166.2.2 `decaf::internal::nio::ByteBuffer::ByteBuffer (unsigned char * array, int size, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a **ByteBuffer** (p. 1004) object that wraps the given array.

Parameters

<i>array</i>	The array to wrap.
<i>size</i>	The size of the array passed.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The size of the sub-array, this is the limit we read and write to.
<i>readOnly</i>	Should this buffer be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset and length are violated.

6.166.2.3 `decaf::internal::nio::ByteBuffer::ByteBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & array, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **ByteBuffer** (p. 1004) will be that of the remaining capacity of the passed buffer.

Parameters

<i>array</i>	The ByteArrayAdapter to wrap
<i>offset</i>	The offset into array where the buffer starts
<i>length</i>	The length of the array we are wrapping or limit.
<i>readOnly</i>	Boolean indicating if this a readOnly buffer.

Exceptions

<i>NullPointerException</i>	if array is NULL
<i>IndexOutOfBoundsException</i>	if offset is greater than array capacity.

6.166.2.4 `decaf::internal::nio::ByteBuffer::ByteBuffer (const ByteBuffer & other)`

Create a **ByteBuffer** (p. 1004) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters

<i>other</i>	The ByteBuffer (p. 1004) this one is to mirror.
--------------	--

6.166.2.5 `virtual decaf::internal::nio::ByteBuffer::~~ByteBuffer () [virtual]`

6.166.3 Member Function Documentation

6.166.3.1 `virtual unsigned char* decaf::internal::nio::ByteBuffer::array
() throw (decaf::nio::ReadOnlyBufferException,
decaf::lang::exceptions::UnsupportedOperationException)
[virtual]`

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is backed by an array but is read-only
<i>UnsupportedOperationException</i>	if this buffer is not backed by an accessible array

Implements `decaf::nio::ByteBuffer` (p. 1056).

6.166.3.2 `virtual int decaf::internal::nio::ByteBuffer::arrayOffset ()
const throw (decaf::nio::ReadOnlyBufferException,
decaf::lang::exceptions::UnsupportedOperationException)
[virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position `p` corresponds to array index `p + arrayOffset()` (p. 1057).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is backed by an array but is read-only.
--	--

<i>UnsupportedOperationException</i>	if this buffer is not backed by an accessible array.
--------------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 1057).

6.166.3.3 `virtual decaf::nio::CharBuffer* decaf::internal::nio::ByteBuffer::asCharBuffer () const`
`[inline, virtual]`

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new Char **Buffer** (p. 936), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 1057).

6.166.3.4 `virtual decaf::nio::DoubleBuffer* decaf::internal::nio::ByteBuffer::asDoubleBuffer () const`
`[inline, virtual]`

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new double **Buffer** (p. 936), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 1058).

6.166.3.5 `virtual decaf::nio::FloatBuffer* decaf::internal::nio::ByteBuffer::asFloatBuffer () const`
`[inline, virtual]`

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new float **Buffer** (p. 936), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 1058).

```
6.166.3.6  virtual decaf::nio::IntBuffer* decaf::internal::nio::ByteBuffer::asIntBuffer (
            ) const [inline, virtual]
```

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new int **Buffer** (p. 936), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 1058).

```
6.166.3.7  virtual decaf::nio::LongBuffer* de-
            caf::internal::nio::ByteBuffer::asLongBuffer (    ) const
            [inline, virtual]
```

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 936), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 1059).

6.166.3.8 `virtual ByteBuffer* decaf::internal::nio::ByteBuffer::asReadOnlyBuffer () const [virtual]`

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 1059).

6.166.3.9 `virtual decaf::nio::ShortBuffer* decaf::internal::nio::ByteBuffer::asShortBuffer () const [inline, virtual]`

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 936), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 1059).

6.166.3.10 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's

position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 1049).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.
--	------------------------------

Implements **decaf::nio::ByteBuffer** (p. 1060).

6.166.3.11 `virtual ByteBuffer* decaf::internal::nio::ByteBuffer::duplicate ()`
[virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new **Byte Buffer** (p. 936) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 1060).

6.166.3.12 `virtual unsigned char decaf::internal::nio::ByteBuffer::get () const throw (decaf::nio::BufferUnderflowException)` [virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if the buffer's current position is not smaller than its limit.
--	---

Implements **decaf::nio::ByteBuffer** (p. 1061).

6.166.3.13 virtual unsigned char decaf::internal::nio::ByteBuffer::get (int *index*)
const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 1062).

6.166.3.14 virtual char decaf::internal::nio::ByteBuffer::getChar () throw (decaf::nio::BufferUnderflowException) [inline, virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implements **decaf::nio::ByteBuffer** (p. 1063).

6.166.3.15 virtual char decaf::internal::nio::ByteBuffer::getChar (int *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Reads one byte at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the byte is to be read.
--------------	---

Returns

the char at the given index in the buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 1063).

6.166.3.16 `virtual double decaf::internal::nio::ByteBuffer::getDouble () throw (decaf::nio::BufferUnderflowException) [virtual]`

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implements **decaf::nio::ByteBuffer** (p. 1064).

6.166.3.17 `virtual double decaf::internal::nio::ByteBuffer::getDouble (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the double at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 1064).

6.166.3.18 virtual float decaf::internal::nio::ByteBuffer::getFloat () throw (decaf::nio::BufferUnderflowException) [virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implements **decaf::nio::ByteBuffer** (p. 1064).

6.166.3.19 virtual float decaf::internal::nio::ByteBuffer::getFloat (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the float at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 1065).

6.166.3.20 virtual int decaf::internal::nio::ByteBuffer::getInt () throw (decaf::nio::BufferUnderflowException) [virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implements **decaf::nio::ByteBuffer** (p. 1065).

6.166.3.21 `virtual int decaf::internal::nio::ByteBuffer::getInt (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the int at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---	--

Implements **decaf::nio::ByteBuffer** (p. 1066).

6.166.3.22 `virtual long long decaf::internal::nio::ByteBuffer::getLong () throw (decaf::nio::BufferUnderflowException)` [virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implements **decaf::nio::ByteBuffer** (p. 1066).

6.166.3.23 `virtual long long decaf::internal::nio::ByteBuffer::getLong (int index)
const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the long long at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 1066).

6.166.3.24 `virtual short decaf::internal::nio::ByteBuffer::getShort (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Reads two bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the short at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 1067).

6.166.3.25 `virtual short decaf::internal::nio::ByteBuffer::getShort () throw (decaf::nio::BufferUnderflowException) [virtual]`

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implements **decaf::nio::ByteBuffer** (p. 1067).

6.166.3.26 `virtual bool decaf::internal::nio::ByteBuffer::hasArray () const` [inline, virtual]

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ByteBuffer** (p. 1068).

6.166.3.27 `virtual bool decaf::internal::nio::ByteBuffer::isReadOnly () const` [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 1068).

6.166.3.28 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::put (unsigned char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)` [virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	- the byte value to be written.
--------------	---------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not smaller than its limit.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1068).

6.166.3.29 virtual **ByteBuffer& decaf::internal::nio::ByteBuffer::put**
(int *index*, unsigned char *value*) throw (**decaf::lang::exceptions::IndexOutOfBoundsException**,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given byte into this buffer at the given index.

Parameters

<i>index</i>	- position in the Buffer (p. 936) to write the data
<i>value</i>	- the byte to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1069).

6.166.3.30 virtual **ByteBuffer& decaf::internal::nio::ByteBuffer::putChar**
(int *index*, char *value*) throw (**decaf::lang::exceptions::IndexOutOfBoundsException**,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 1072).

6.166.3.31 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putChar**
(char *value*) throw (decaf::nio::BufferOverflowException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 1071).

6.166.3.32 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putDouble**
(int *index*, double *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1073).

6.166.3.33 virtual **ByteBuffer&** decaf::internal::nio::ByteBuffer::putDouble
(double *value*) throw (decaf::nio::BufferOverflowException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 1072).

6.166.3.34 virtual **ByteBuffer&** decaf::internal::nio::ByteBuffer::putFloat
(int *index*, float *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1074).

6.166.3.35 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putFloat (float *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)** [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1073).

6.166.3.36 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putInt (int *index*, int *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)** [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 1074).

6.166.3.37 virtual **ByteBuffer&** decaf::internal::nio::ByteBuffer::putInt
(int *value*) throw (decaf::nio::BufferOverflowException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 1075).

6.166.3.38 virtual **ByteBuffer&** decaf::internal::nio::ByteBuffer::putLong
(long long *value*) throw (decaf::nio::BufferOverflowException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1075).

6.166.3.39 virtual **ByteBuffer&** **decaf::internal::nio::ByteBuffer::putLong**
(**int** *index*, **long long** *value*) throw (**decaf::lang::exceptions::IndexOutOfBoundsException**,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1076).

6.166.3.40 virtual **ByteBuffer&** **decaf::internal::nio::ByteBuffer::putShort**
(**short** *value*) throw (**decaf::nio::BufferOverflowException**,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1077).

6.166.3.41 virtual **ByteBuffer&** decaf::internal::nio::ByteBuffer::putShort (int *index*, short *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 1076).

6.166.3.42 virtual void decaf::internal::nio::ByteBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteBuffer** (p. 1004) as Read-Only or not Read-Only.

Parameters

<i>value</i>	Boolean value, true if this buffer is to be read-only, false otherwise.
--------------	---

6.166.3.43 `virtual ByteBuffer* decaf::internal::nio::ByteBuffer::slice () const`
`[virtual]`

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ByteBuffer** (p. 1049) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 1077).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/ByteBuffer.h`

6.167 decaf::io::ByteArrayInputStream Class Reference

A **ByteArrayInputStream** (p. 1038) contains an internal buffer that contains bytes that may be read from the stream.

```
#include <src/main/decaf/io/ByteArrayInputStream.h>
```

Inheritance diagram for `decaf::io::ByteArrayInputStream`:

Public Member Functions

- **ByteArrayInputStream ()**

*Creates an **ByteArrayInputStream** (p. 1038) with an empty input buffer, the buffer can be initialized with a call to `setByteArray`.*

- **ByteArrayInputStream (const std::vector< unsigned char > &buffer)**

Creates the input stream and calls `setBuffer` with the specified buffer object.

- **ByteArrayInputStream (const unsigned char *buffer, int bufferSize, bool own=false)**

`throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)`

*Create an instance of the **ByteArrayInputStream** (p. 1038) with the given buffer as the source of input for all read operations.*

- **ByteArrayInputStream** (const unsigned char *buffer, int bufferSize, int offset, int length, bool own=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Create an instance of the **ByteArrayInputStream** (p. 1038) with the given buffer as the source of input for all read operations.

- virtual ~**ByteArrayInputStream** ()
- virtual void **setByteArray** (const std::vector< unsigned char > &buffer)
- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Sets the internal buffer.

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

- virtual int **available** () const throw (IOException)

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2210)	if an I/O error occurs.
------------------------------	-------------------------

- virtual long long **skip** (long long num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.
-----	------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
UnsupportedOperationException	<i>if the concrete stream class does not support skipping bytes.</i>

- virtual void **mark** (int readLimit)

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	<i>The max bytes read before marked position is invalid.</i>
-----------	--

- virtual void **reset** () throw (IOException)

Repositions this stream to the position at the time the mark method was last called on this input stream.

*If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2210) might be thrown. * If such an **IOException** (p. 2210) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

*If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2210). * If an **IOException** (p. 2210) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

*The default implementation of this method throws an **IOException** (p. 2210).*

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** () throw (IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

6.167.1 Detailed Description

A **ByteArrayInputStream** (p. 1038) contains an internal buffer that contains bytes that may be read from the stream. An internal counter keeps track of the next byte to be supplied by the read method. The **ByteArrayInputStream** (p. 1038) never copies the supplied buffers, only points to them, therefore the caller must ensure that the supplied buffer remain in scope, or is not deleted before this **ByteArrayInputStream** (p. 1038) is freed. If the own argument of one of the constructors that accepts an array pointer is set to true than the **ByteArrayInputStream** (p. 1038) instance will take ownership of the supplied pointer and delete it when that instance is destroyed.

Closing a **ByteArrayInputStream** (p. 1038) has no effect. The methods in this class can be called after the stream has been closed without generating an **IOException** (p. 2210).

Since

1.0

6.167.2 Constructor & Destructor Documentation

6.167.2.1 decaf::io::ByteArrayInputStream::ByteArrayInputStream ()

Creates an **ByteArrayInputStream** (p. 1038) with an empty input buffer, the buffer can be initialized with a call to **setByteArray**.

6.167.2.2 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const std::vector< unsigned char > & buffer)

Creates the input stream and calls **setBuffer** with the specified buffer object.

Parameters

<i>buffer</i>	The buffer to be used.
---------------	------------------------

6.167.2.3 `decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * buffer, int bufferSize, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)`

Create an instance of the **ByteArrayInputStream** (p. 1038) with the given buffer as the source of input for all read operations.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.
<i>own</i>	Indicates if this object should take ownership of the array, default is false.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgumentEx-ception</i>	if the bufferSize is negative.

6.167.2.4 `decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * buffer, int bufferSize, int offset, int length, bool own = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)`

Create an instance of the **ByteArrayInputStream** (p. 1038) with the given buffer as the source of input for all read operations.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.
<i>offset</i>	The offset into the buffer to begin reading from.
<i>length</i>	The number of bytes to read past the offset.
<i>own</i>	Indicates if this object should take ownership of the array, default is false.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgumentEx-ception</i>	if the bufferSize is negative.

6.167.2.5 `virtual decaf::io::ByteArrayInputStream::~~ByteArrayInputStream ()`
`[virtual]`

6.167.3 Member Function Documentation

6.167.3.1 `virtual int decaf::io::ByteArrayInputStream::available () const throw (IOException)`
`[virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 2107).

6.167.3.2 `virtual int decaf::io::ByteArrayInputStream::doReadArrayBounded (unsigned char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`
`[protected, virtual]`

Reimplemented from **decaf::io::InputStream** (p. 2108).

6.167.3.3 `virtual int decaf::io::ByteArrayInputStream::doReadByte () throw (IOException)`
`[protected, virtual]`

Implements **decaf::io::InputStream** (p. 2109).

6.167.3.4 `virtual void decaf::io::ByteArrayInputStream::mark (int readLimit)`
`[virtual]`

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit

is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

<i>readLimit</i>	The max bytes read before marked position is invalid.
------------------	---

Reimplemented from **decaf::io::InputStream** (p. 2109).

6.167.3.5 `virtual bool decaf::io::ByteArrayInputStream::markSupported () const`
`[inline, virtual]`

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::InputStream** (p. 2109).

6.167.3.6 `virtual void decaf::io::ByteArrayInputStream::reset () throw (IOException)`
`[virtual]`

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2210) might be thrown. * If such an **IOException** (p. 2210) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2210). * If an **IOException** (p. 2210) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 2210).

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error occurs.
--	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 2113).

6.167.3.7 `virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char *
buffer, int bufferSize) throw (decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgumentEx- ception</i>	if the bufferSize is negative.

6.167.3.8 `virtual void decaf::io::ByteArrayInputStream::setByteArray (const std::vector<
unsigned char > &buffer) [virtual]`

Sets the internal buffer.

The input stream will wrap around this buffer and will perform all read operations on it. The position will be reinitialized to the beginning of the specified buffer. This class will not own the given buffer - it is the caller's responsibility to free the memory of the given buffer as appropriate.

Parameters

<i>buffer</i>	The buffer to be used.
---------------	------------------------

6.167.3.9 `virtual void decaf::io::ByteArrayInputStream::setByteArray (const
unsigned char * buffer, int bufferSize, int offset, int length)
throw (decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.
<i>offset</i>	The offset into the buffer to begin reading from.
<i>length</i>	The number of bytes to read past the offset.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgumentEx- ception</i>	if the bufferSize is negative.

6.167.3.10 `virtual long long decaf::io::ByteArrayInputStream::skip (long long num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)`
[virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error occurs.
<i>UnsupportedOperationEx- ception</i>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 2113).

The documentation for this class was generated from the following file:

- src/main/decaf/io/ByteArrayInputStream.h

Clear current Stream contents.
- virtual std::string **toString** () const
Converts the bytes in the buffer into a standard C++ string.
- void **writeTo** (**OutputStream** *out) const throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using out.write(buf, 0, count).

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value) throw (decaf::io::IOException)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

6.168.1 Constructor & Destructor Documentation

6.168.1.1 `decaf::io::ByteArrayOutputStream::ByteArrayOutputStream ()`

Default Constructor - uses a default internal buffer of 32 bytes, the size increases as the need for more room arises.

6.168.1.2 `decaf::io::ByteArrayOutputStream::ByteArrayOutputStream (int bufferSize) throw (decaf::lang::exceptions::IllegalArgumentException)`

Creates a **ByteArrayOutputStream** (p. 1046) with an internal buffer allocated with the given size.

Parameters

<i>bufferSize</i>	The size to use for the internal buffer.
-------------------	--

Exceptions

<i>IllegalArgumentException</i>	if the size is less than or equal to zero.
---------------------------------	--

6.168.1.3 `virtual decaf::io::ByteArrayOutputStream::~~ByteArrayOutputStream ()` [virtual]

6.168.2 Member Function Documentation

6.168.2.1 `virtual void decaf::io::ByteArrayOutputStream::doWriteArrayBounded (const unsigned char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)` [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2994).

6.168.2.2 `virtual void decaf::io::ByteArrayOutputStream::doWriteByte (unsigned char value) throw (decaf::io::IOException)` [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2994).

6.168.2.3 `virtual void decaf::io::ByteArrayOutputStream::reset () throw (IOException)` [virtual]

Clear current Stream contents.

Exceptions

<i>IOException</i> (p. 2210)	
---------------------------------	--

6.168.2.4 long long decaf::io::ByteArrayOutputStream::size () const

Gets the current count of bytes written into this **ByteArrayOutputStream** (p. 1046).

Returns

the number of valid bytes contained in the **ByteArrayOutputStream** (p. 1046).

6.168.2.5 std::pair<unsigned char*, int> decaf::io::ByteArrayOutputStream::toByteArray () const

Creates a newly allocated byte array.

Its size is the current size of this output stream and the valid contents of the buffer have been copied into it. The newly allocated array and its size are returned inside an STL pair structure, the caller is responsible for freeing the returned array.

Returns

an STL pair containing the copied array and its size.

6.168.2.6 virtual std::string decaf::io::ByteArrayOutputStream::toString () const [virtual]

Converts the bytes in the buffer into a standard C++ string.

Returns

a string containing the bytes in the buffer

Reimplemented from **decaf::io::OutputStream** (p. 2995).

6.168.2.7 void decaf::io::ByteArrayOutputStream::writeTo(OutputStream * out) const throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using out.write(buf, 0, count).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**ByteArrayOutputStream.h**

6.169 decaf::nio::ByteBuffer Class Reference

This class defines six categories of operations upon byte buffers:

```
#include <src/main/decaf/nio/ByteBuffer.h>
```

Inheritance diagram for decaf::nio::ByteBuffer:

Public Member Functions

- virtual **~ByteBuffer** ()
- virtual std::string **toString** () const
- **ByteBuffer & get** (std::vector< unsigned char > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **ByteBuffer & get** (unsigned char *buffer, int size, int offset, int length) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)
Relative bulk get method.
- **ByteBuffer & put** (ByteBuffer &src) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException)
This method transfers the bytes remaining in the given source buffer into this buffer.
- **ByteBuffer & put** (const unsigned char *buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)
This method transfers bytes into this buffer from the given source array.
- **ByteBuffer & put** (std::vector< unsigned char > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source byte array into this buffer.
- virtual bool **isReadOnly** () const =0
Tells whether or not this buffer is read-only.
- virtual unsigned char * **array** ()=0 throw (ReadOnlyBufferException, decaf::lang::exceptions::UnsupportedOperationException)
Returns the byte array that backs this buffer.
- virtual int **arrayOffset** () const =0 throw (ReadOnlyBufferException, decaf::lang::exceptions::UnsupportedOperationException)
Returns the offset within this buffer's backing array of the first element of the buffer.
- virtual bool **hasArray** () const =0

Tells whether or not this buffer is backed by an accessible byte array.

- virtual **CharBuffer** * **asCharBuffer** () const =0
Creates a view of this byte buffer as a char buffer.
- virtual **DoubleBuffer** * **asDoubleBuffer** () const =0
Creates a view of this byte buffer as a double buffer.
- virtual **FloatBuffer** * **asFloatBuffer** () const =0
Creates a view of this byte buffer as a float buffer.
- virtual **IntBuffer** * **asIntBuffer** () const =0
Creates a view of this byte buffer as a int buffer.
- virtual **LongBuffer** * **asLongBuffer** () const =0
Creates a view of this byte buffer as a long buffer.
- virtual **ShortBuffer** * **asShortBuffer** () const =0
Creates a view of this byte buffer as a short buffer.
- virtual **ByteBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only byte buffer that shares this buffer's content.
- virtual **ByteBuffer** & **compact** ()=0 throw (**ReadOnlyBufferException**)
Compacts this buffer.
- virtual **ByteBuffer** * **duplicate** ()=0
Creates a new byte buffer that shares this buffer's content.
- virtual unsigned char **get** () const =0 throw (**BufferUnderflowException**)
Relative get method.
- virtual unsigned char **get** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual char **getChar** ()=0 throw (**BufferUnderflowException**)
Reads the next byte at this buffer's current position, and then increments the position by one.
- virtual char **getChar** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads one byte at the given index and returns it.
- virtual double **getDouble** ()=0 throw (**BufferUnderflowException**)
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

- virtual double **getDouble** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual float **getFloat** ()=0 throw (BufferUnderflowException)
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual float **getFloat** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual long long **getLong** ()=0 throw (BufferUnderflowException)
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual long long **getLong** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual int **getInt** ()=0 throw (BufferUnderflowException)
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual int **getInt** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual short **getShort** ()=0 throw (BufferUnderflowException)
Reads the next two bytes at this buffer's current position, and then increments the position by that amount.
- virtual short **getShort** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads two bytes at the given index and returns it.
- virtual **ByteBuffer & put** (unsigned char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given byte into this buffer at the current position, and then increments the position.
- virtual **ByteBuffer & put** (int index, unsigned char value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given byte into this buffer at the given index.
- virtual **ByteBuffer & putChar** (char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

- virtual **ByteBuffer & putChar** (int index, char value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes one byte containing the given value, into this buffer at the given index.

- virtual **ByteBuffer & putDouble** (double value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer & putDouble** (int index, double value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer & putFloat** (float value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer & putFloat** (int index, float value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer & putLong** (long long value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer & putLong** (int index, long long value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer & putInt** (int value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer & putInt** (int index, int value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer & putShort** (short value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putShort** (int index, short value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** * **slice** () const =0

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

- virtual int **compareTo** (const **ByteBuffer** &value) const

- virtual bool **equals** (const **ByteBuffer** &value) const

- virtual bool **operator==** (const **ByteBuffer** &value) const

- virtual bool **operator<** (const **ByteBuffer** &value) const

Static Public Member Functions

- static **ByteBuffer** * **allocate** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **ByteBuffer** * **wrap** (unsigned char *array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

*Wraps the passed buffer with a new **ByteBuffer** (p. 1049).*

- static **ByteBuffer** * **wrap** (std::vector< unsigned char > &buffer)

*Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 1049).*

Protected Member Functions

- **ByteBuffer** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)

*Creates a **ByteBuffer** (p. 1049) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.169.1 Detailed Description

This class defines six categories of operations upon byte buffers: 1. Absolute and relative get and put methods that read and write single bytes; 2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer; 4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 1064) float **getFloat(int index)** void **putFloat(float f)** (p. 1073) void **putFloat(int index, float f)** (p. 1074)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The **asFloatBuffer** method, for example, creates an instance of the **FloatBuffer** (p. 1985) class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

6.169.2 Constructor & Destructor Documentation

6.169.2.1 `decaf::nio::ByteBuffer::ByteBuffer (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)` [protected]

Creates a **ByteBuffer** (p. 1049) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size of the array, this is the limit we read and write to.
-----------------	--

Exceptions

<i>IllegalArgumentException</i>	if capacity is negative.
---------------------------------	--------------------------

6.169.2.2 `virtual decaf::nio::ByteBuffer::~~ByteBuffer ()` [inline, virtual]

6.169.3 Member Function Documentation

6.169.3.1 `static ByteBuffer* decaf::nio::ByteBuffer::allocate (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)` [static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated **ByteBuffer** (p. 1049) which the caller owns.

Exceptions

<i>IllegalArgumentException</i>	if capacity is negative.
---------------------------------	--------------------------

6.169.3.2 `virtual unsigned char* decaf::nio::ByteBuffer::array () throw (ReadOnlyBufferException, decaf::lang::exceptions::UnsupportedOperationException)` [pure virtual]

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is backed by an array but is read-only
<i>UnsupportedOperationException</i>	if this buffer is not backed by an accessible array

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1020).

6.169.3.3 `virtual int decaf::nio::ByteBuffer::arrayOffset ()
const throw (ReadOnlyBufferException,
decaf::lang::exceptions::UnsupportedOperationException) [pure
virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position `p` corresponds to array index `p + arrayOffset()` (p. 1057).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is backed by an array but is read-only.
<i>UnsupportedOperationException</i>	if this buffer is not backed by an accessible array.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1020).

6.169.3.4 `virtual CharBuffer* decaf::nio::ByteBuffer::asCharBuffer () const [pure
virtual]`

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new Char **Buffer** (p. 936), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1021).

6.169.3.5 `virtual DoubleBuffer* decaf::nio::ByteBuffer::asDoubleBuffer () const` [pure virtual]

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new double **Buffer** (p. 936), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1021).

6.169.3.6 `virtual FloatBuffer* decaf::nio::ByteBuffer::asFloatBuffer () const` [pure virtual]

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new float **Buffer** (p. 936), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1021).

6.169.3.7 `virtual IntBuffer* decaf::nio::ByteBuffer::asIntBuffer () const` `[pure virtual]`

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new int **Buffer** (p. 936), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1022).

6.169.3.8 `virtual LongBuffer* decaf::nio::ByteBuffer::asLongBuffer () const` `[pure virtual]`

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 936), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1022).

6.169.3.9 `virtual ByteBuffer* decaf::nio::ByteBuffer::asReadOnlyBuffer () const` `[pure virtual]`

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1023).

6.169.3.10 `virtual ShortBuffer* decaf::nio::ByteBuffer::asShortBuffer () const` [pure virtual]

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 936), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1023).

6.169.3.11 `virtual ByteBuffer& decaf::nio::ByteBuffer::compact () throw (ReadOnlyBufferException)` [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 1049).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.
--	------------------------------

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1023).

6.169.3.12 `virtual int decaf::nio::ByteBuffer::compareTo (const ByteBuffer & value) const`
[virtual]

6.169.3.13 `virtual ByteBuffer* decaf::nio::ByteBuffer::duplicate ()` [pure virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new Byte **Buffer** (p. 936) which the caller owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1024).

6.169.3.14 `virtual bool decaf::nio::ByteBuffer::equals (const ByteBuffer & value) const`
[virtual]

6.169.3.15 `ByteBuffer& decaf::nio::ByteBuffer::get (std::vector< unsigned char > buffer)`
`throw (BufferUnderflowException)`

Relative bulk get method.

This method transfers bytes from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this Byte **Buffer** (p. 936).

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are fewer than length bytes remaining in this buffer
--	---

6.169.3.16 `virtual unsigned char decaf::nio::ByteBuffer::get () const throw (`
`BufferUnderflowException)` [pure virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if the buffer's current position is not smaller than its limit.
--	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1024).

6.169.3.17 `virtual unsigned char decaf::nio::ByteBuffer::get (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Absolute get method.

Reads the byte at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1025).

6.169.3.18 `ByteBuffer& decaf::nio::ByteBuffer::get (unsigned char * buffer, int size, int offset, int length) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`

Relative bulk get method.

This method transfers bytes from this buffer into the given destination array. If there are fewer bytes remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 941), then no bytes are transferred and a **BufferUnderflowException** (p. 967) is thrown.

Otherwise, this method copies `length` bytes from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of

this buffer is then incremented by length.

Parameters

<i>buffer</i>	The pointer to an allocated buffer to fill.
<i>size</i>	The size of the passed in Buffer (p. 936).
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 936).

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.
BufferUnderflowException (p. 967)	if there are fewer than length bytes remaining in this buffer.
<i>NullPointerException</i>	if the passed buffer is null.

6.169.3.19 virtual char decaf::nio::ByteBuffer::getChar () throw (**BufferUnderflowException**) [pure virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

BufferUnderflowException (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1025).

6.169.3.20 virtual char decaf::nio::ByteBuffer::getChar (int *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Reads one byte at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the byte is to be read.
--------------	---

Returns

the char at the given index in the buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1025).

6.169.3.21 virtual double decaf::nio::ByteBuffer::getDouble () throw (**BufferUnderflowException**) [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1026).

6.169.3.22 virtual double decaf::nio::ByteBuffer::getDouble (int *index*) const throw (**decaf::lang::exceptions::IndexOutOfBoundsException**) [pure virtual]

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the double at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1026).

6.169.3.23 virtual float decaf::nio::ByteBuffer::getFloat () throw (**BufferUnderflowException**) [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1027).

6.169.3.24 virtual float decaf::nio::ByteBuffer::getFloat (int *index*) const throw (**decaf::lang::exceptions::IndexOutOfBoundsException**) [pure virtual]

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the float at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1027).

6.169.3.25 virtual int decaf::nio::ByteBuffer::getInt () throw (**BufferUnderflowException**) [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1027).

6.169.3.26 `virtual int decaf::nio::ByteBuffer::getInt (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the int at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1028).

6.169.3.27 `virtual long long decaf::nio::ByteBuffer::getLong () throw (BufferUnderflowException)` [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1028).

6.169.3.28 `virtual long long decaf::nio::ByteBuffer::getLong (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the long long at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1029).

6.169.3.29 `virtual short decaf::nio::ByteBuffer::getShort () throw (BufferUnderflowException) [pure virtual]`

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1029).

6.169.3.30 `virtual short decaf::nio::ByteBuffer::getShort (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Reads two bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the bytes are to be read.
--------------	---

Returns

the short at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1029).

6.169.3.31 `virtual bool decaf::nio::ByteBuffer::hasArray () const` [pure virtual]

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1030).

6.169.3.32 `virtual bool decaf::nio::ByteBuffer::isReadOnly () const` [pure virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 940).

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1030).

6.169.3.33 `virtual bool decaf::nio::ByteBuffer::operator< (const ByteBuffer & value) const` [virtual]

6.169.3.34 `virtual bool decaf::nio::ByteBuffer::operator== (const ByteBuffer & value) const` [virtual]

6.169.3.35 `virtual ByteBuffer& decaf::nio::ByteBuffer::put (unsigned char value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	- the byte value to be written.
--------------	---------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not smaller than its limit.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1030).

6.169.3.36 virtual **ByteBuffer&** decaf::nio::ByteBuffer::put (int *index*, unsigned char *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes the given byte into this buffer at the given index.

Parameters

<i>index</i>	- position in the Buffer (p. 936) to write the data
<i>value</i>	- the byte to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1031).

6.169.3.37 **ByteBuffer&** decaf::nio::ByteBuffer::put (**ByteBuffer &** *src*) throw (**BufferOverflowException**, **ReadOnlyBufferException**, decaf::lang::exceptions::IllegalArgumentException)

This method transfers the bytes remaining in the given source buffer into this buffer.

If there are more bytes remaining in the source buffer than in this buffer, that is, if

`src.remaining() > remaining()` (p. 941), then no bytes are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies `n = src.remaining()` bytes from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

<i>src</i>	The buffer to take bytes from an place in this one.
------------	---

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 964)	if there is insufficient space in this buffer for the remaining bytes in the source buffer
IllegalArgumentException	if the source buffer is this buffer
ReadOnlyBufferException (p. 3260)	if this buffer is read-only

6.169.3.38 `ByteBuffer& decaf::nio::ByteBuffer::put (const unsigned char * buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`

This method transfers bytes into this buffer from the given source array.

If there are more bytes to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 941), then no bytes are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given `offset` in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

<i>buffer</i>	The array from which bytes are to be read.
<i>size</i>	The size of the given array.
<i>offset</i>	The offset within the array of the first byte to be read.
<i>length</i>	The number of bytes to be read from the given array.

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there is insufficient space in this buffer.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.169.3.39 ByteBuffer& decaf::nio::ByteBuffer::put (std::vector< unsigned char > & *buffer*) throw (**BufferOverflowException, **ReadOnlyBufferException**)**

This method transfers the entire content of the given source byte array into this buffer.

This is the same as calling put(&buffer[0], buffer.size(), 0, buffer.size())

Parameters

<i>buffer</i>	The buffer whose contents are copied to this ByteBuffer (p. 1049).
---------------	---

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there is insufficient space in this buffer.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

6.169.3.40 virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (char *value*) throw (**BufferOverflowException, **ReadOnlyBufferException**) [pure virtual]**

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1032).

6.169.3.41 `virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (int index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1031).

6.169.3.42 `virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (double value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1033).

6.169.3.43 `virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (int index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1032).

6.169.3.44 `virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (float value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1034).

6.169.3.45 **virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (int *index*, float *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)** [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1033).

6.169.3.46 **virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int *index*, int *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)** [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1034).

6.169.3.47 `virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 3260)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1035).

6.169.3.48 `virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (long long value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1035).

6.169.3.49 virtual **ByteBuffer&** decaf::nio::ByteBuffer::putLong (int *index*, long long *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1036).

6.169.3.50 virtual **ByteBuffer&** decaf::nio::ByteBuffer::putShort (int *index*, short *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1037).

6.169.3.51 `virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (short value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 1036).

6.169.3.52 `virtual ByteBuffer* decaf::nio::ByteBuffer::slice () const` [pure virtual]

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of

bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ByteBuffer** (p. 1049) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 1038).

6.169.3.53 `virtual std::string decaf::nio::ByteBuffer::toString () const` [virtual]

Returns

a std::string describing this object

6.169.3.54 `static ByteBuffer* decaf::nio::ByteBuffer::wrap (unsigned char * array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)` [static]

Wraps the passed buffer with a new **ByteBuffer** (p. 1049).

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>array</i>	The array that will back the new buffer.
<i>size</i>	The size of the provided array.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new **ByteBuffer** (p. 1049) that is backed by buffer, caller owns.

Exceptions

<i>NullPointerException</i>	if the array passed in is NULL.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.169.3.55 `static ByteBuffer* decaf::nio::ByteBuffer::wrap (std::vector< unsigned char > & buffer) [static]`

Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 1049).

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new **ByteBuffer** (p. 1049) that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/ByteBuffer.h`

6.170 cms::ByteMessage Class Reference

A **ByteMessage** (p. 1079) object is used to send a message containing a stream of unsigned bytes.

```
#include <src/main/cms/ByteMessage.h>
```

Inheritance diagram for `cms::ByteMessage`:

Public Member Functions

- virtual `~ByteMessage ()`
- virtual void **setBodyBytes** (const unsigned char *buffer, int numBytes)=0 throw (cms::MessageNotWriteableException, cms::CMSException)
sets the bytes given to the message body.
- virtual unsigned char * **getBodyBytes** () const =0 throw (cms::MessageNotReadableException, cms::CMSException)
Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.
- virtual int **getBodyLength** () const =0 throw (cms::MessageNotReadableException, cms::CMSException)
Returns the number of bytes contained in the body of this message.

- virtual void **reset** ()=0 throw (cms::MessageFormatException, cms::CMSEException)
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a byte to the bytes message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char *buffer, int length) const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a portion of the bytes message stream.
- virtual void **writeBytes** (const unsigned char *value, int offset, int length)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a Char from the Bytes message stream.
- virtual void **writeChar** (char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a char to the bytes message stream as a 1-byte value.

- virtual float **readFloat** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a signed short to the bytes message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 16 bit unsigned short from the Bytes message stream.
- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 32 bit signed integer from the Bytes message stream.
- virtual void **writeInt** (int value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a long long to the bytes message stream as a 8 byte value.

- virtual std::string **readString** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads an ASCII String from the Bytes message stream.

- virtual void **writeString** (const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes an ASCII String to the Bytes message stream.

- virtual std::string **readUTF** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

*Reads an UTF String from the **BytesMessage** (p. 1079) stream.*

- virtual void **writeUTF** (const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

*Writes an UTF String to the **BytesMessage** (p. 1079) stream.*

- virtual **BytesMessage** * **clone** () const =0

Clones this message.

6.170.1 Detailed Description

A **BytesMessage** (p. 1079) object is used to send a message containing a stream of unsigned bytes. It inherits from the **Message** (p. 2614) interface and adds a bytes message body. The receiver of the message supplies the interpretation of the bytes using the methods added by the **BytesMessage** (p. 1079) interface.

The **BytesMessage** (p. 1079) methods are based largely on those found in **decaf.io.DataInputStream** (p. 1612) and **decaf.io.DataOutputStream** (p. 1628).

Although the CMS API allows the use of message properties with byte messages, they are typically not used, since the inclusion of properties may affect the format.

The primitive types can be written explicitly using methods for each type. Because the C++ language is more limited when dealing with primitive types the JMS equivalent generic read and write methods that take Java objects cannot be provided in the CMS API.

When the message is first created, and when **clearBody** is called, the body of the message is in write-only mode. After the first call to **reset** has been made, the message body is in read-only mode. After a message has been sent, the client that sent it can retain and modify it without affecting the message that has been sent. The same message object can be sent multiple times. When a message has been received, the provider has called **reset** so that the message body is in read-only mode for the client.

If **clearBody** is called on a message in read-only mode, the message body is cleared and the message is in write-only mode.

If a client attempts to read a message in write-only mode, a **MessageNotReadableException** (p. 2807) is thrown.

If a client attempts to write a message in read-only mode, a **MessageNotWriteableException** (p. 2808) is thrown.

Since

1.0

6.170.2 Constructor & Destructor Documentation

6.170.2.1 `virtual cms::ByteMessage::~ByteMessage () [inline, virtual]`

6.170.3 Member Function Documentation

6.170.3.1 `virtual ByteMessage* cms::ByteMessage::clone () const [pure virtual]`

Clones this message.

Returns

a deep copy of this message.

Exceptions

CMSException (p. 1190)	- if an internal error occurs while cloning the Message (p. 2614).
----------------------------------	---

Implements **cms::Message** (p. 2620).

Implemented in **activemq::commands::ActiveMQByteMessage** (p. 219).

6.170.3.2 `virtual unsigned char* cms::ByteMessage::getBodyBytes () const throw (cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions

<i>CMSEException</i> (p. 1190)	- If an internal error occurs.
<i>MessageNotReadableException</i> (p. 2807)	- If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 220).

6.170.3.3 `virtual int cms::BytesMessage::getBodyLength () const throw (cms::MessageNotReadableException, cms::CMSEException)` [pure virtual]

Returns the number of bytes contained in the body of this message.

Returns

number of bytes.

Exceptions

<i>CMSEException</i> (p. 1190)	- If an internal error occurs.
<i>MessageNotReadableException</i> (p. 2807)	- If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 221).

6.170.3.4 `virtual bool cms::BytesMessage::readBoolean () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)` [pure virtual]

Reads a Boolean from the Bytes message stream.

Returns

boolean value from stream

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 221).

6.170.3.5 `virtual unsigned char cms::BytesMessage::readByte () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Byte from the Bytes message stream.

Returns

unsigned char value from stream

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 222).

6.170.3.6 `virtual int cms::BytesMessage::readBytes (std::vector< unsigned char > & value) const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a byte array from the bytes message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

<i>value</i>	buffer to place data in
--------------	-------------------------

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 222).

```
6.170.3.7 virtual int cms::BytesMessage::readBytes ( unsigned char *
            buffer, int length ) const throw ( cms::MessageEOFException,
            cms::MessageNotReadableException, cms::CMSException ) [pure
            virtual]
```

Reads a portion of the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an `IndexOutOfBoundsException` is thrown. No bytes will be read from the stream for this exception case.

Parameters

<i>buffer</i>	the buffer into which the data is read
<i>length</i>	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 223).

6.170.3.8 `virtual char cms::BytesMessage::readChar () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Char from the Bytes message stream.

Returns

char value from stream

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 224).

6.170.3.9 `virtual double cms::BytesMessage::readDouble () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 64 bit double from the Bytes message stream.

Returns

double value from stream

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 224).

6.170.3.10 `virtual float cms::BytesMessage::readFloat () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException) [pure virtual]`

Reads a 32 bit float from the Bytes message stream.

Returns

double value from stream

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 225).

6.170.3.11 `virtual int cms::BytesMessage::readInt () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException) [pure virtual]`

Reads a 32 bit signed integer from the Bytes message stream.

Returns

int value from stream

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 225).

6.170.3.12 virtual long long cms::BytesMessage::readLong () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 64 bit long from the Bytes message stream.

Returns

long long value from stream

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 226).

6.170.3.13 virtual short cms::BytesMessage::readShort () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns

short value from stream

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 226).

6.170.3.14 `virtual std::string cms::BytesMessage::readString () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException) [pure virtual]`

Reads an ASCII String from the Bytes message stream.

Returns

String from stream

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 227).

6.170.3.15 `virtual unsigned short cms::BytesMessage::readUnsignedShort () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException) [pure virtual]`

Reads a 16 bit unsigned short from the Bytes message stream.

Returns

unsigned short value from stream

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 227).

6.170.3.16 virtual std::string cms::BytesMessage::readUTF () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException) [pure virtual]

Reads an UTF String from the **BytesMessage** (p. 1079) stream.

Returns

String from stream

Exceptions

CMSEException (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException (p. 2747)	- if unexpected end of bytes stream has been reached.
MessageNotReadableException (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 228).

6.170.3.17 virtual void cms::BytesMessage::reset () throw (cms::MessageFormatException, cms::CMSEException) [pure virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions

CMSEException (p. 1190)	- If the provider fails to perform the reset operation.
MessageFormatException (p. 2749)	- If the Message (p. 2614) has an invalid format.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 228).

6.170.3.18 virtual void cms::BytesMessage::setBodyBytes (const unsigned char * buffer, int numBytes) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]

sets the bytes given to the message body.

Parameters

<i>buffer</i>	Byte Buffer to copy
<i>numBytes</i>	Number of bytes in Buffer to copy

Exceptions

<i>CMSEException</i> (p. 1190)	- If an internal error occurs.
<i>MessageNotWriteableException</i> (p. 2808)	- if in Read Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 228).

6.170.3.19 `virtual void cms::BytesMessage::writeBoolean (bool value) throw (cms::MessageNotWriteableException, cms::CMSEException)` [pure virtual]

Writes a boolean to the bytes message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

<i>value</i>	boolean to write to the stream
--------------	--------------------------------

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 229).

6.170.3.20 `virtual void cms::BytesMessage::writeByte (unsigned char value) throw (cms::MessageNotWriteableException, cms::CMSEException)` [pure virtual]

Writes a byte to the bytes message stream as a 1-byte value.

Parameters

<i>value</i>	byte to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 229).

6.170.3.21 `virtual void cms::BytesMessage::writeBytes (const std::vector< unsigned char > & value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 230).

6.170.3.22 `virtual void cms::BytesMessage::writeBytes (const unsigned char * value, int offset, int length) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a portion of a byte array to the bytes message stream.
size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
<i>offset</i>	the initial offset within the byte array
<i>length</i>	the number of bytes to use

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 230).

6.170.3.23 `virtual void cms::BytesMessage::writeChar (char value) throw (cms::MessageNotWriteableException, cms::CMSEException)` [pure virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters

<i>value</i>	char to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 231).

6.170.3.24 `virtual void cms::BytesMessage::writeDouble (double value) throw (cms::MessageNotWriteableException, cms::CMSEException)` [pure virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters

<i>value</i>	double to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 231).

6.170.3.25 `virtual void cms::BytesMessage::writeFloat (float value) throw (cms::MessageNotWriteableException, cms::CMSEException)` [pure virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters

<i>value</i>	float to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 232).

6.170.3.26 `virtual void cms::BytesMessage::writeInt (int value) throw (cms::MessageNotWriteableException, cms::CMSException)` [pure virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters

<i>value</i>	signed int to write to the stream
--------------	-----------------------------------

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 232).

6.170.3.27 `virtual void cms::BytesMessage::writeLong (long long value) throw (cms::MessageNotWriteableException, cms::CMSException)` [pure virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters

<i>value</i>	signed long long to write to the stream
--------------	---

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 232).

6.170.3.28 `virtual void cms::BytesMessage::writeShort (short value) throw (cms::MessageNotWriteableException, cms::CMSException)` [pure virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters

<i>value</i>	signed short to write to the stream
--------------	-------------------------------------

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 233).

6.170.3.29 `virtual void cms::BytesMessage::writeString (const std::string & value) throw (cms::MessageNotWriteableException, cms::CMSException)` [pure virtual]

Writes an ASCII String to the Bytes message stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 233).

6.170.3.30 `virtual void cms::BytesMessage::writeUnsignedShort (unsigned short value) throw (cms::MessageNotWriteableException, cms::CMSException)` [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

<i>value</i>	unsigned short to write to the stream
--------------	---------------------------------------

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 234).

6.170.3.31 `virtual void cms::BytesMessage::writeUTF (const std::string & value) throw (cms::MessageNotWritableException, cms::CMSEException) [pure virtual]`

Writes an UTF String to the **BytesMessage** (p. 1079) stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSEException</i> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i> (p. 2747)	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 234).

The documentation for this class was generated from the following file:

6.171 activemq::cmsutil::CachedConsumer Class Reference

A cached message consumer contained within a pooled session.

```
#include <src/main/activemq/cmsutil/CachedConsumer.h>
```

Inheritance diagram for **activemq::cmsutil::CachedConsumer**:

Public Member Functions

- **CachedConsumer** (cms::MessageConsumer *consumer)

- virtual `~CachedConsumer ()`
- virtual void `close ()` throw (cms::CMSEException)
Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual `cms::Message * receive ()` throw (cms::CMSEException)
Synchronously Receive a Message.
- virtual `cms::Message * receive (int millisecs)` throw (cms::CMSEException)
Synchronously Receive a Message, time out after defined interval.
- virtual `cms::Message * receiveNoWait ()` throw (cms::CMSEException)
Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.
- virtual void `setMessageListener (cms::MessageListener *listener)` throw (cms::CMSEException)
Sets the MessageListener that this class will send notifis on.
- virtual `cms::MessageListener * getMessageListener ()` const throw (cms::CMSEException)
Gets the MessageListener that this class will send mew Message notification events to.
- virtual std::string `getMessageSelector ()` const throw (cms::CMSEException)
Gets this message consumer's message selector expression.

Protected Member Functions

- `CachedConsumer (const CachedConsumer &)`
- `CachedConsumer & operator= (const CachedConsumer &)`

6.171.1 Detailed Description

A cached message consumer contained within a pooled session.

6.171.2 Constructor & Destructor Documentation

6.171.2.1 `activemq::cmsutil::CachedConsumer::CachedConsumer (const CachedConsumer &) [inline, protected]`

6.171.2.2 `activemq::cmsutil::CachedConsumer::CachedConsumer (cms::MessageConsumer * consumer) [inline]`

6.171.2.3 `virtual activemq::cmsutil::CachedConsumer::~~CachedConsumer () [inline, virtual]`

6.171.3 Member Function Documentation

6.171.3.1 `virtual void activemq::cmsutil::CachedConsumer::close () throw (cms::CMSEException) [inline, virtual]`

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements `cms::Closeable` (p. 1180).

6.171.3.2 `virtual cms::MessageListener* activemq::cmsutil::CachedConsumer::getMessageListener () const throw (cms::CMSEException) [inline, virtual]`

Gets the MessageListener that this class will send new Message notification events to.

Returns

The listener of messages received by this consumer

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements `cms::MessageConsumer` (p. 2675).

6.171.3.3 `virtual std::string activemq::cmsutil::CachedConsumer::getMessageSelector () const throw (cms::CMSEException) [inline, virtual]`

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 2676).

6.171.3.4 **CachedConsumer& activemq::cmsutil::CachedConsumer::operator= (const
CachedConsumer &)** [inline, protected]

6.171.3.5 **virtual cms::Message* activemq::cmsutil::CachedConsumer::receive () throw (cms::CMSEException)** [inline, virtual]

Synchronously Receive a Message.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 2676).

6.171.3.6 **virtual cms::Message* activemq::cmsutil::CachedConsumer::receive (int millisecs
) throw (cms::CMSEException)** [inline, virtual]

Synchronously Receive a Message, time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 2676).

6.171.3.7 **virtual cms::Message* activemq::cmsutil::CachedConsumer::receiveNoWait ()
throw (cms::CMSEException)** [inline, virtual]

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 2677).

6.171.3.8 `virtual void activemq::cmsutil::CachedConsumer::setMessageListener (cms::MessageListener * listener) throw (cms::CMSEException)`
`[inline, virtual]`

Sets the MessageListener that this class will send notifs on.

Parameters

<i>listener</i>	The listener of messages received by this consumer.
-----------------	---

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 2677).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/CachedConsumer.h

6.172 activemq::cmsutil::CachedProducer Class Reference

A cached message producer contained within a pooled session.

```
#include <src/main/activemq/cmsutil/CachedProducer.h>
```

Inheritance diagram for activemq::cmsutil::CachedProducer:

Public Member Functions

- **CachedProducer** (**cms::MessageProducer** *producer)
- virtual **~CachedProducer** ()
- virtual void **close** () throw (cms::CMSEException)
Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual void **send** (**cms::Message** *message) throw (cms::CMSEException)
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message) throw (cms::CMSEException)
Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **setDeliveryMode** (int mode) throw (cms::CMSEException)
Sets the delivery mode for this Producer.
- virtual int **getDeliveryMode** () const throw (cms::CMSEException)
Gets the delivery mode for this Producer.
- virtual void **setDisableMessageID** (bool value) throw (cms::CMSEException)
Sets if Message Ids are disabled for this Producer.
- virtual bool **getDisableMessageID** () const throw (cms::CMSEException)
Gets if Message Ids are disabled for this Producer.
- virtual void **setDisableMessageTimeStamp** (bool value) throw (cms::CMSEException)
Sets if Message Time Stamps are disabled for this Producer.
- virtual bool **getDisableMessageTimeStamp** () const throw (cms::CMSEException)
Gets if Message Time Stamps are disabled for this Producer.
- virtual void **setPriority** (int priority) throw (cms::CMSEException)
Sets the Priority that this Producers sends messages at.
- virtual int **getPriority** () const throw (cms::CMSEException)
Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time) throw (cms::CMSEException)
Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () const throw (cms::CMSEException)
Gets the Time to Live that this producer sends messages with.

- **CachedProducer** & **operator=** (const **CachedProducer** &)

6.172.1 Detailed Description

A cached message producer contained within a pooled session.

6.172.2 Constructor & Destructor Documentation

6.172.2.1 `activemq::cmsutil::CachedProducer::CachedProducer (const CachedProducer &) [inline, protected]`

6.172.2.2 `activemq::cmsutil::CachedProducer::CachedProducer (cms::MessageProducer * producer) [inline]`

6.172.2.3 `virtual activemq::cmsutil::CachedProducer::~~CachedProducer () [inline, virtual]`

6.172.3 Member Function Documentation

6.172.3.1 `virtual void activemq::cmsutil::CachedProducer::close () throw (cms::CMSEException) [inline, virtual]`

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements `cms::Closeable` (p. 1180).

6.172.3.2 `virtual int activemq::cmsutil::CachedProducer::getDeliveryMode () const throw (cms::CMSEException) [inline, virtual]`

Gets the delivery mode for this Producer.

Returns

The DeliveryMode

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements `cms::MessageProducer` (p. 2811).

6.172.3.3 `virtual bool activemq::cmsutil::CachedProducer::getDisableMessageID () const throw (cms::CMSEException) [inline, virtual]`

Gets if Message Ids are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2812).

6.172.3.4 `virtual bool activemq::cmsutil::CachedProducer::getDisableMessageTimeStamp ()
const throw (cms::CMSEException) [inline, virtual]`

Gets if Message Time Stamps are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2812).

6.172.3.5 `virtual int activemq::cmsutil::CachedProducer::getPriority () const throw (cms::CMSEException) [inline, virtual]`

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2812).

6.172.3.6 `virtual long long activemq::cmsutil::CachedProducer::getTimeToLive () const throw (cms::CMSEException) [inline, virtual]`

Gets the Time to Live that this producer sends messages with.

Returns

Time to live value in milliseconds

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2813).

6.172.3.7 **CachedProducer& activemq::cmsutil::CachedProducer::operator= (const CachedProducer &)** [inline, protected]

6.172.3.8 **virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)** [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

<i>message</i>	The message to be sent.
<i>delivery-Mode</i>	The delivery mode to be used.
<i>priority</i>	The priority for this message.
<i>timeToLive</i>	The time to live value for this message in milliseconds.

Exceptions

<i>CMSEException</i>	- if an internal error occurs while sending the message.
<i>MessageFormatException</i>	- if an Invalid Message is given.
<i>InvalidDestinationException</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>UnsupportedOperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2813).

6.172.3.9 **virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * destination, cms::Message * message) throw (cms::CMSEException)** [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

<i>destination</i>	The destination on which to send the message
<i>message</i>	the message to be sent.

Exceptions

<i>CMSEException</i>	- if an internal error occurs while sending the message.
----------------------	--

<i>MessageFormatException</i>	- if an Invalid Message is given.
<i>InvalidDestinationException</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>UnsupportedOperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2815).

6.172.3.10 `virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message) throw (cms::CMSEException) [inline, virtual]`

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

<i>message</i>	The message to be sent.
----------------	-------------------------

Exceptions

<i>CMSEException</i>	- if an internal error occurs while sending the message.
<i>MessageFormatException</i>	- if an Invalid Message is given.
<i>InvalidDestinationException</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>UnsupportedOperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2814).

6.172.3.11 `virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * destination, cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException) [inline, virtual]`

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

<i>destination</i>	The destination on which to send the message
<i>message</i>	The message to be sent.
<i>delivery-Mode</i>	The delivery mode to be used.
<i>priority</i>	The priority for this message.
<i>timeToLive</i>	The time to live value for this message in milliseconds.

Exceptions

<i>CMSEException</i>	- if an internal error occurs while sending the message.
<i>MessageFormatException</i>	- if an Invalid Message is given.
<i>InvalidDestinationException</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>UnsupportedOperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2814).

6.172.3.12 `virtual void activemq::cmsutil::CachedProducer::setDeliveryMode (int mode) throw (cms::CMSEException) [inline, virtual]`

Sets the delivery mode for this Producer.

Parameters

<i>mode</i>	The DeliveryMode
-------------	------------------

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2816).

6.172.3.13 `virtual void activemq::cmsutil::CachedProducer::setDisableMessageID (bool value) throw (cms::CMSEException) [inline, virtual]`

Sets if Message Ids are disabled for this Producer.

Parameters

<i>value</i>	boolean indicating enable / disable (true / false)
--------------	--

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2816).

6.172.3.14 `virtual void activemq::cmsutil::CachedProducer::setDisableMessageTimeStamp (bool value) throw (cms::CMSEException) [inline, virtual]`

Sets if Message Time Stamps are disabled for this Producer.

Parameters

<i>value</i>	- boolean indicating enable / disable (true / false)
--------------	--

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2816).

6.172.3.15 `virtual void activemq::cmsutil::CachedProducer::setPriority (int priority) throw (cms::CMSEException)` [inline, virtual]

Sets the Priority that this Producers sends messages at.

Parameters

<i>priority</i>	int value for Priority level
-----------------	------------------------------

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2817).

6.172.3.16 `virtual void activemq::cmsutil::CachedProducer::setTimeToLive (long long time) throw (cms::CMSEException)` [inline, virtual]

Sets the Time to Live that this Producers sends messages with.

This value will be used if the time to live is not specified via the send method.

Parameters

<i>time</i>	default time to live value in milliseconds
-------------	--

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 2817).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CachedProducer.h`

6.173 decaf::util::concurrent::Callable< V > Class Template Reference

A task that returns a result and may throw an exception.

```
#include <src/main/decaf/util/concurrent/Callable.h>
```

Public Member Functions

- virtual `~Callable()`
- virtual `V call()`=0 throw (decaf::lang::Exception)

Computes a result, or throws an exception if unable to do so.

6.173.1 Detailed Description

`template<typename V> class decaf::util::concurrent::Callable< V >`

A task that returns a result and may throw an exception. Implementors define a single method with no arguments called `call`. This interface differs from the `Runnable` interface in that a **Callable** (p. 1108) object can return a result and is allowed to throw an exceptions from its `call` method.

The `Executors` class contains utility methods to convert from other common forms to **Callable** (p. 1108) classes.

Since

1.0

6.173.2 Constructor & Destructor Documentation

6.173.2.1 `template<typename V> virtual decaf::util::concurrent::Callable< V >::~~Callable()` [inline, virtual]

6.173.3 Member Function Documentation

6.173.3.1 `template<typename V> virtual V decaf::util::concurrent::Callable< V >::call()` throw (decaf::lang::Exception) [pure virtual]

Computes a result, or throws an exception if unable to do so.

Returns

Computed Result.

Exceptions

<i>Exception</i>	If unable to compute a result.
------------------	--------------------------------

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Callable.h`

6.174 decaf::util::concurrent::CancellationException Class Reference

```
#include <src/main/decaf/util/concurrent/CancellationException.h>
```

Inheritance diagram for decaf::util::concurrent::CancellationException:

Public Member Functions

- **CancellationException** () throw ()
Default Constructor.
- **CancellationException** (const decaf::lang::Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **CancellationException** (const CancellationException &ex) throw ()
Copy Constructor.
- **CancellationException** (const std::exception *cause) throw ()
Constructor.
- **CancellationException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **CancellationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **CancellationException** * clone () const
Clones this exception.
- virtual ~**CancellationException** () throw ()

6.174.1 Constructor & Destructor Documentation

6.174.1.1 decaf::util::concurrent::CancellationException::CancellationException () throw ()
[inline]

Default Constructor.

6.174.1.2 decaf::util::concurrent::CancellationException::CancellationException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.174.1.3 `decaf::util::concurrent::CancellationException::CancellationException (const CancellationException & ex) throw () [inline]`

Copy Constructor.

Parameters

<i>ex</i>	- The Exception to copy in this new instance.
-----------	---

6.174.1.4 `decaf::util::concurrent::CancellationException::CancellationException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.174.1.5 `decaf::util::concurrent::CancellationException::CancellationException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>msg</i>	- The message to report
<i>...</i>	- list of primitives that are formatted into the message

6.174.1.6 `decaf::util::concurrent::CancellationException::CancellationException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
-------------	--

<i>lineNumber</i>	- The line number where the exception occurred.
<i>cause</i>	- The exception that was the cause for this one to be thrown.
<i>msg</i>	- The message to report
...	- list of primitives that are formatted into the message

6.174.1.7 `virtual decaf::util::concurrent::CancellationException::~~CancellationException ()
throw () [inline, virtual]`

6.174.2 Member Function Documentation

6.174.2.1 `virtual CancellationException* de-
caf::util::concurrent::CancellationException::clone () const
[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from `decaf::lang::Exception` (p. 1889).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/CancellationException.h`

6.175 decaf::security::cert::Certificate Class Reference

Base interface for all identity certificates.

```
#include <src/main/decaf/security/cert/Certificate.h>
```

Inheritance diagram for `decaf::security::cert::Certificate`:

Public Member Functions

- `virtual ~Certificate ()`
- `virtual bool equals (const Certificate &cert) const =0`
Compares the encoded form of the two certificates.
- `virtual void getEncoded (std::vector< unsigned char > &output) const =0 throw
(CertificateEncodingException)`

Provides the encoded form of this certificate.

- virtual std::string **getType** () const =0
Returns the type of this certificate.
- virtual **PublicKey** * **getPublicKey** ()=0
Gets the public key of this certificate.
- virtual const **PublicKey** * **getPublicKey** () const =0
Gets the public key of this certificate.
- virtual void **verify** (const **PublicKey** &publicKey) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual void **verify** (const **PublicKey** &publicKey, const std::string &sigProvider) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual std::string **toString** () const =0
Returns a string representation of this certificate.

6.175.1 Detailed Description

Base interface for all identity certificates.

6.175.2 Constructor & Destructor Documentation

6.175.2.1 virtual decaf::security::cert::Certificate::~Certificate () [inline, virtual]

6.175.3 Member Function Documentation

6.175.3.1 virtual bool decaf::security::cert::Certificate::equals (const Certificate & cert) const [pure virtual]

Compares the encoded form of the two certificates.

Parameters

<i>cert</i>	The certificate to be tested for equality with this certificate.
-------------	--

Returns

true if the given certificate is equal to this certificate.

6.175.3.2 `virtual void decaf::security::cert::Certificate::getEncoded (std::vector< unsigned char > & output) const throw (CertificateEncodingException)` [pure virtual]

Provides the encoded form of this certificate.

Parameters

<i>output</i>	Receives the encoded form of this certificate.
---------------	--

Exceptions

<i>CertificateEncodingException</i> (p. 1116)	if an encoding error occurs
---	-----------------------------

6.175.3.3 `virtual PublicKey* decaf::security::cert::Certificate::getPublicKey ()` [pure virtual]

Gets the public key of this certificate.

Returns

the public key

6.175.3.4 `virtual const PublicKey* decaf::security::cert::Certificate::getPublicKey () const` [pure virtual]

Gets the public key of this certificate.

Returns

the public key

6.175.3.5 `virtual std::string decaf::security::cert::Certificate::getType () const` [pure virtual]

Returns the type of this certificate.

Returns

the type of this certificate

6.175.3.6 `virtual std::string decaf::security::cert::Certificate::toString () const [pure virtual]`

Returns a string representation of this certificate.

Returns

a string representation of this certificate

6.175.3.7 `virtual void decaf::security::cert::Certificate::verify (const PublicKey & publicKey, const std::string & sigProvider) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]`

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Uses the verification engine of the specified provider.

Parameters

<i>publicKey</i>	The public key used to carry out the validation.
<i>sigProvider</i>	The name of the signature provider

Exceptions

<i>NoSuchAlgorithmException</i> (p. 2907)	- on unsupported signature algorithms.
<i>InvalidKeyException</i> (p. 2201)	- on incorrect key.
<i>NoSuchProviderException</i> (p. 2913)	- if there's no default provider.
<i>SignatureException</i> (p. 3601)	- on signature errors.
<i>CertificateException</i> (p. 1118)	- on encoding errors.

6.175.3.8 `virtual void decaf::security::cert::Certificate::verify (const PublicKey & publicKey) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]`

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters

<i>publicKey</i>	The public key used to carry out the validation.
------------------	--

Exceptions

<i>NoSuchAlgorithmException</i> (p. 2907)	- on unsupported signature algorithms.
<i>InvalidKeyException</i> (p. 2201)	- on incorrect key.
<i>NoSuchProviderException</i> (p. 2913)	- if there's no default provider.
<i>SignatureException</i> (p. 3601)	- on signature errors.
<i>CertificateException</i> (p. 1118)	- on encoding errors.

The documentation for this class was generated from the following file:

- src/main/decaf/security/cert/**Certificate.h**

6.176 decaf::security::cert::CertificateEncodingException Class Reference

```
#include <src/main/decaf/security/cert/CertificateEncodingException.h>
```

Inheritance diagram for decaf::security::cert::CertificateEncodingException:

Public Member Functions

- **CertificateEncodingException** () throw ()
Default Constructor.
- **CertificateEncodingException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **CertificateEncodingException** (const **CertificateEncodingException** &ex) throw ()
Copy Constructor.
- **CertificateEncodingException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.

- virtual **CertificateEncodingException** * **clone** () const
Clones this exception.
- virtual ~**CertificateEncodingException** () throw ()

6.176.1 Constructor & Destructor Documentation

6.176.1.1 decaf::security::cert::CertificateEncodingException::CertificateEncodingException () throw () [inline]

Default Constructor.

6.176.1.2 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.176.1.3 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const CertificateEncodingException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.176.1.4 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.
<i>msg</i>	message to report
...	list of primitives that are formatted into the message

6.176.1.5 `virtual decaf::security::cert::CertificateEncodingException::~~CertificateEncodingException () throw () [inline, virtual]`

6.176.2 Member Function Documentation

6.176.2.1 `virtual CertificateEncodingException* decaf::security::cert::CertificateEncodingException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p. 1120).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/cert/CertificateEncodingException.h`

6.177 decaf::security::cert::CertificateException Class Reference

Clones this exception.

- virtual `~CertificateException () throw ()`

6.177.1 Constructor & Destructor Documentation

6.177.1.1 `decaf::security::cert::CertificateException::CertificateException () throw ()`
`[inline]`

Default Constructor.

6.177.1.2 `decaf::security::cert::CertificateException::CertificateException (const Exception & ex) throw ()` `[inline]`

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.177.1.3 `decaf::security::cert::CertificateException::CertificateException (const CertificateException & ex) throw ()` `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.177.1.4 `decaf::security::cert::CertificateException::CertificateException (const char * file, const int lineNumber, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.
<i>msg</i>	message to report
<i>...</i>	list of primitives that are formatted into the message

6.177.1.5 **virtual** `decaf::security::cert::CertificateException::~~CertificateException () throw ()`
`[inline, virtual]`

6.177.2 Member Function Documentation

6.177.2.1 **virtual** `CertificateException*` `decaf::security::cert::CertificateException::clone () const` `[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::GeneralSecurityException` (p. 2037).

Reimplemented in `decaf::security::cert::CertificateEncodingException` (p. 1118),

`decaf::security::cert::CertificateExpiredException` (p. 1122), `decaf::security::cert::CertificateNotYetValidException` (p. 1124), and `decaf::security::cert::CertificateParsingException` (p. 1126).

-----------	--

6.178.1.4 decaf::security::cert::CertificateExpiredException::CertificateExpiredException (const char * file, const int lineNumber, const char * msg, ...) throw ()
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.

<i>msg</i>	message to report
...	list of primitives that are formatted into the message

6.178.1.5 `virtual decaf::security::cert::CertificateExpiredException::~CertificateExpiredException () throw () [inline, virtual]`

6.178.2 Member Function Documentation

6.178.2.1 `virtual CertificateExpiredException* decaf::security::cert::CertificateExpiredException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p. 1120).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/cert/CertificateExpiredException.h`

6.179 decaf::security::cert::CertificateNotYetValidException Class Reference

```
#include <src/main/decaf/security/cert/CertificateNotYetValidException.h>
```

Inheritance diagram for `decaf::security::cert::CertificateNotYetValidException`:

Public Member Functions

- **CertificateNotYetValidException () throw ()**
Default Constructor.
- **CertificateNotYetValidException (const Exception &ex) throw ()**
Conversion Constructor from some other Exception.
- **CertificateNotYetValidException (const CertificateNotYetValidException &ex) throw ()**

6.179 decaf::security::cert::CertificateNotYetValidException Class Reference 123

Copy Constructor.

- **CertificateNotYetValidException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **CertificateNotYetValidException** * clone () const

Clones this exception.

- virtual ~**CertificateNotYetValidException** () throw ()

6.179.1 Constructor & Destructor Documentation

6.179.1.1 decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException () throw () [inline]

Default Constructor.

6.179.1.2 decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.179.1.3 decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException (const CertificateNotYetValidException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.179.1.4 decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.
<i>msg</i>	message to report
<i>...</i>	list of primitives that are formatted into the message

6.179.1.5 `virtual decaf::security::cert::CertificateNotYetValidException::~~CertificateNotYetValidException () throw () [inline, virtual]`

6.179.2 Member Function Documentation

6.179.2.1 `virtual CertificateNotYetValidException* decaf::security::cert::CertificateNotYetValidException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p. 1120).

Inheritance diagram for `decaf::lang::Character`:

Public Member Functions

- **Character** (char value)
- virtual int **compareTo** (const **Character** &c) const
*Compares this **Character** (p. 1126) instance with another.*
- virtual bool **operator==** (const **Character** &c) const
Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Character** &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const char &c) const
*Compares this **Character** (p. 1126) instance with a char type.*
- virtual bool **operator==** (const char &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const char &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- bool **equals** (const **Character** &c) const
- bool **equals** (const char &c) const
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static **Character** **valueOf** (char value)
*Returns a **Character** (p. 1126) instance representing the specified char value.*
- static bool **isWhitespace** (char c)
Indicates whether or not the given character is considered whitespace.
- static bool **isDigit** (char c)

Indicates whether or not the given character is a digit.

- static bool **isLowerCase** (char c)

Indicates whether or not the given character is a lower case character.

- static bool **isUpperCase** (char c)

Indicates whether or not the given character is a upper case character.

- static bool **isLetter** (char c)

Indicates whether or not the given character is a letter.

- static bool **isLetterOrDigit** (char c)

Indicates whether or not the given character is either a letter or a digit.

- static bool **isISOControl** (char c)

Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

- static int **digit** (char c, int radix)

Returns the numeric value of the character ch in the specified radix.

Static Public Attributes

- static const int **MIN_RADIX** = 2

The minimum radix available for conversion to and from strings.

- static const int **MAX_RADIX** = 36

The maximum radix available for conversion to and from strings.

- static const char **MIN_VALUE** = (char)0x7F

The minimum value that a signed char can take on.

- static const char **MAX_VALUE** = (char)0x80

The maximum value that a signed char can take on.

- static const int **SIZE** = 8

The size of the primitive charactor in bits.

6.181.1 Constructor & Destructor Documentation

6.181.1.1 decaf::lang::Character::Character (char value)

Parameters

<i>value</i>	- char to wrap.
--------------	-----------------

6.181.2 Member Function Documentation

6.181.2.1 `virtual unsigned char decaf::lang::Character::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2919).

6.181.2.2 `virtual int decaf::lang::Character::compareTo (const char & c) const [inline, virtual]`

Compares this **Character** (p. 1126) instance with a char type.

Parameters

<i>c</i>	- the char instance to be compared
----------	------------------------------------

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **char** > (p. 1249).

6.181.2.3 `virtual int decaf::lang::Character::compareTo (const Character & c) const [inline, virtual]`

Compares this **Character** (p. 1126) instance with another.

Parameters

<i>c</i>	- the Character (p. 1126) instance to be compared
----------	--

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Character** > (p. 1249).

6.181.2.4 static int decaf::lang::Character::digit (char *c*, int *radix*) [static]

Returns the numeric value of the character *ch* in the specified radix.

If the radix is not in the range `MIN_RADIX <= radix <= MAX_RADIX` or if the value of *ch* is not a valid digit in the specified radix, -1 is returned. A character is a valid digit if at least one of the following is true:

* The method `isDigit` is true of the character and the single-character decomposition is less than the specified radix. In this case the decimal digit value is returned. * The character is one of the uppercase Latin letters 'A' through 'Z' and its code is less than `radix + 'A' - 10`. In this case, `ch - 'A' + 10` is returned. * The character is one of the lowercase Latin letters 'a' through 'z' and its code is less than `radix + 'a' - 10`. In this case, `ch - 'a' + 10` is returned.

Parameters

<i>c</i>	- the char to be converted
<i>radix</i>	- the radix of the number

Returns

the numeric value of the number represented in the given radix

6.181.2.5 virtual double decaf::lang::Character::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2919).

6.181.2.6 bool decaf::lang::Character::equals (const char & *c*) const [inline, virtual]**Returns**

true if the two Characters have the same value.

Implements **decaf::lang::Comparable< char >** (p. 1250).

6.181.2.7 bool decaf::lang::Character::equals (const Character & *c*) const [inline, virtual]**Returns**

true if the two **Character** (p. 1126) Objects have the same value.

Implements **decaf::lang::Comparable< Character >** (p. 1250).

6.181.2.8 `virtual float decaf::lang::Character::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.181.2.9 `virtual int decaf::lang::Character::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.181.2.10 `static bool decaf::lang::Character::isDigit (char c) [inline, static]`

Indicates whether or not the given character is a digit.

6.181.2.11 `static bool decaf::lang::Character::isISOControl (char c) [inline, static]`

Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

Parameters

<i>c</i>	- the character, including supplementary characters
----------	---

Returns

true if the char is an ISO control character

6.181.2.12 `static bool decaf::lang::Character::isLetter (char c) [inline, static]`

Indicates whether or not the given character is a letter.

6.181.2.13 `static bool decaf::lang::Character::isLetterOrDigit (char c) [inline, static]`

Indicates whether or not the given character is either a letter or a digit.

6.181.2.14 `static bool decaf::lang::Character::isLowerCase (char c) [inline, static]`

Indicates whether or not the given character is a lower case character.

6.181.2.15 `static bool decaf::lang::Character::isUpperCase (char c) [inline, static]`

Indicates whether or not the given character is a upper case character.

6.181.2.16 `static bool decaf::lang::Character::isWhitespace (char c) [inline, static]`

Indicates whether or not the given character is considered whitespace.

6.181.2.17 `virtual long long decaf::lang::Character::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.181.2.18 `virtual bool decaf::lang::Character::operator< (const Character & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>c</i>	- the value to be compared to this one.
----------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Character >** (p. 1250).

6.181.2.19 `virtual bool decaf::lang::Character::operator< (const char & c) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< char >** (p. 1250).

6.181.2.20 `virtual bool decaf::lang::Character::operator== (const Character & c) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Character >** (p. 1250).

6.181.2.21 `virtual bool decaf::lang::Character::operator== (const char & c) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< char >** (p. 1250).

6.181.2.22 `virtual short decaf::lang::Character::shortValue () const` `[inline, virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2920).

6.181.2.23 `std::string decaf::lang::Character::toString () const`

Returns

this **Character** (p. 1126) Object as a **String** (p. 3775) Representation

6.181.2.24 `static Character decaf::lang::Character::valueOf (char value)` `[inline, static]`

Returns a **Character** (p. 1126) instance representing the specified char value.

Parameters

<i>value</i>	- the primitive char to wrap.
--------------	-------------------------------

Returns

a new Charactor instance that wraps this value.

6.181.3 Field Documentation

6.181.3.1 `const int decaf::lang::Character::MAX_RADIX = 36` `[static]`

The maximum radix available for conversion to and from strings.

6.181.3.2 `const char decaf::lang::Character::MAX_VALUE = (char)0x80` `[static]`

The maximum value that a signed char can take on.

6.181.3.3 `const int decaf::lang::Character::MIN_RADIX = 2` `[static]`

The minimum radix available for conversion to and from strings.

6.181.3.4 `const char decaf::lang::Character::MIN_VALUE = (char)0x7F` [static]

The minimum value that a signed char can take on.

6.181.3.5 `const int decaf::lang::Character::SIZE = 8` [static]

The size of the primitive character in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Character.h`

6.182 decaf::internal::nio::CharArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/CharArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::CharArrayBuffer:

Public Member Functions

- **CharArrayBuffer** (int size, bool **readOnly**=false) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **CharArrayBuffer** (p. 1135) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **CharArrayBuffer** (char *array, int size, int **offset**, int **length**, bool **readOnly**=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a **CharArrayBuffer** (p. 1135) object that wraps the given array.*
- **CharArrayBuffer** (const decaf::lang::Pointer< **ByteArrayAdapter** > &array, int **offset**, int **length**, bool **readOnly**=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **CharArrayBuffer** (const **CharArrayBuffer** &other)
*Create a **CharArrayBuffer** (p. 1135) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*
- virtual **~CharArrayBuffer** ()
- virtual char * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

*the array that backs this **Buffer** (p. 936).*

Exceptions

ReadOnlyBufferException (p. 3260)	<i>if this Buffer (p. 936) is read only.</i>
UnsupportedOperationException	<i>if the underlying store has no array.</i>

- virtual int **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 3260)	<i>if this Buffer (p. 936) is read only.</i>
UnsupportedOperationException	<i>if the underlying store has no array.</i>

- virtual CharBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

- virtual CharBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to

index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index `limit()` (p. 940) - 1 is copied to index $n = \text{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 1148).

Exceptions

ReadOnlyBufferException (p. 3260)	- If this buffer is read-only
---	-------------------------------

- virtual CharBuffer * **duplicate** ()

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 936) which the caller owns.

- virtual char **get** () throw (decaf::nio::BufferUnderflowException)

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

BufferUnderflowException (p. 967)	if there no more data to return
---	---------------------------------

- virtual char **get** (int index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

Reads the char at the given index.

Parameters

index	The index in the Buffer (p. 936) where the char is to be read.
-------	---

Returns

the char that is located at the given index.

Exceptions

IndexOutOfBoundsException	if index is not smaller than the buffer's limit or is negative.
----------------------------------	---

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () const

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

- virtual CharBuffer & **put** (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

value	<i>The char value to be written.</i>
-------	--------------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	<i>if this buffer's current position is not smaller than its limit</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual CharBuffer & **put** (int index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes the given char into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 936) to write the data.</i>
value	<i>The char to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException (p. 3260)	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual CharBuffer * **slice** () const

Creates a new **CharBuffer** (p. 1148) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 1148) which the caller owns.

- virtual lang::CharSequence * **subSequence** (int start, int end) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 941) + start, and its limit will be **position()** (p. 941) + end. The new **Buffer** (p. 936) will be read-only if, and only if, this buffer is read-only.

Parameters

start	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than remaining() (p. 941).
end	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than remaining() (p. 941).

Returns

The new character buffer, caller owns.

Exceptions

IndexOutOfBoundsException	if the preconditions on start and end fail.
---------------------------	---

Protected Member Functions

- virtual void **setReadOnly** (bool value)

Sets this **CharArrayBuffer** (p. 1135) as Read-Only.

Protected Attributes

- bool **readOnly**
- decaf::lang::Pointer< ByteArrayAdapter > **_array**
- int **offset**

- `int length`

6.182.1 Constructor & Destructor Documentation

6.182.1.1 `decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (int size, bool readOnly = false) throw (decaf::lang::exceptions::IllegalArgumentException)`

Creates a **CharArrayBuffer** (p. 1135) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>size</i>	The size of the array, this is the limit we read and write to.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>IllegalArgumentException</i>	if the capacity value is negative.
---------------------------------	------------------------------------

6.182.1.2 `decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (char * array, int size, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a **CharArrayBuffer** (p. 1135) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The actual array to wrap.
<i>size</i>	The size of the given array.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if offset is greater than array capacity.

6.182.1.3 `decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & array, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **CharArrayBuffer** (p. 1135) will be that of the remaining capacity of the passed buffer.

Parameters

<i>array</i>	The ByteArrayAdapter to wrap.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if array is NULL
<i>IndexOutOfBoundsException</i>	if offset + length is greater than array size.

6.182.1.4 `decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const CharArrayBuffer & other)`

Create a **CharArrayBuffer** (p. 1135) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters

<i>other</i>	The CharArrayBuffer (p. 1135) this one is to mirror.
--------------	---

6.182.1.5 `virtual decaf::internal::nio::CharArrayBuffer::~~CharArrayBuffer () [virtual]`

6.182.2 Member Function Documentation

6.182.2.1 `virtual char* decaf::internal::nio::CharArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 936).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this Buffer (p. 936) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 1154).

6.182.2.2 `virtual int decaf::internal::nio::CharArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this Buffer (p. 936) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 1155).

6.182.2.3 `virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::asReadOnlyBuffer () const [virtual]`

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implements **decaf::nio::CharBuffer** (p. 1155).

6.182.2.4 `virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException)` [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 1148).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	- If this buffer is read-only
--	-------------------------------

Implements **decaf::nio::CharBuffer** (p. 1156).

6.182.2.5 `virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::duplicate ()` [virtual]

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 936) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 1157).

6.182.2.6 virtual char decaf::internal::nio::CharArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there no more data to return
---	---------------------------------

Implements **decaf::nio::CharBuffer** (p. 1157).

6.182.2.7 virtual char decaf::internal::nio::CharArrayBuffer::get (int *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method.

Reads the char at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the char is to be read.
--------------	---

Returns

the char that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit or is negative.
----------------------------------	---

Implements **decaf::nio::CharBuffer** (p. 1157).

6.182.2.8 `virtual bool decaf::internal::nio::CharArrayBuffer::hasArray () const` `[inline, virtual]`

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::CharBuffer** (p. 1159).

6.182.2.9 `virtual bool decaf::internal::nio::CharArrayBuffer::isReadOnly () const` `[inline, virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 940).

6.182.2.10 `virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)` `[virtual]`

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The char value to be written.
--------------	-------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not smaller than its limit
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 1161).

6.182.2.11 `virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (int index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)` [virtual]

Writes the given char into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The char to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 1162).

6.182.2.12 `virtual void decaf::internal::nio::CharArrayBuffer::setReadOnly (bool value)`
[inline, protected, virtual]

Sets this **CharArrayBuffer** (p. 1135) as Read-Only.

Parameters

<i>value</i>	Boolean value, true if this buffer is to be read-only, false otherwise.
--------------	---

6.182.2.13 `virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::slice () const`
[virtual]

Creates a new **CharBuffer** (p. 1148) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 1148) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 1164).

6.182.2.14 `virtual lang::CharSequence* decaf::internal::nio::CharArrayBuffer::subSequence
(int start, int end) const throw (de-
caf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 941) + start, and its limit will be **position()** (p. 941) + end. The new **Buffer** (p. 936) will be read-only if, and only if, this buffer is read-only.

Parameters

<i>start</i>	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than remaining() (p. 941).
<i>end</i>	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than remaining() (p. 941).

Returns

The new character buffer, caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions on start and end fail.
----------------------------------	---

Implements **decaf::nio::CharBuffer** (p. 1165).

6.182.3 Field Documentation

- 6.182.3.1 **decaf::lang::Pointer<ByteArrayAdapter>**
decaf::internal::nio::CharArrayBuffer::_array [protected]
- 6.182.3.2 **int decaf::internal::nio::CharArrayBuffer::length** [protected]
- 6.182.3.3 **int decaf::internal::nio::CharArrayBuffer::offset** [protected]
- 6.182.3.4 **bool decaf::internal::nio::CharArrayBuffer::readOnly** [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/CharArrayBuffer.h

6.183 decaf::nio::CharBuffer Class Reference

This class defines four categories of operations upon character buffers:

```
#include <src/main/decaf/nio/CharBuffer.h>
```

Inheritance diagram for decaf::nio::CharBuffer:

Public Member Functions

- virtual **~CharBuffer** ()
- virtual std::string **toString** () const
- **CharBuffer & append** (char value) throw (BufferOverflowException, ReadOnlyBufferException)
Appends the specified character to this buffer.
- **CharBuffer & append** (const lang::CharSequence *value) throw (BufferOverflowException, ReadOnlyBufferException)
Appends the specified character sequence to this buffer.
- **CharBuffer & append** (const lang::CharSequence *value, int start, int end) throw (decaf::lang::exceptions::IndexOutOfBoundsException, BufferOverflowException, ReadOnlyBufferException)
Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.
- virtual char * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the character array that backs this buffer (optional operation).

- virtual int **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **CharBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only char buffer that shares this buffer's content.
- char **charAt** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads the character at the given index relative to the current position.
- virtual **CharBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **CharBuffer** * **duplicate** ()=0
Creates a new char buffer that shares this buffer's content.
- virtual char **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual char **get** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **CharBuffer** & **get** (std::vector< char > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **CharBuffer** & **get** (char *buffer, int size, int offset, int length) throw (BufferUnderflowException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible char array.
- int **length** () const
Returns the length of this character buffer.
- **CharBuffer** & **put** (**CharBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException)
This method transfers the chars remaining in the given source buffer into this buffer.
- **CharBuffer** & **put** (const char *buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

This method transfers chars into this buffer from the given source array.

- **CharBuffer & put** (std::vector< char > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source char array into this buffer.

- virtual **CharBuffer & put** (char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given char into this buffer at the current position, and then increments the position.

- virtual **CharBuffer & put** (int index, char value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given char into this buffer at the given index.

- **CharBuffer & put** (std::string &src, int start, int end) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException)

Relative bulk put method (optional operation).

- **CharBuffer & put** (const std::string &src) throw (BufferOverflowException, ReadOnlyBufferException)

Relative bulk put method (optional operation).

- virtual int **read** (**CharBuffer** *target) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, ReadOnlyBufferException)

Attempts to read characters into the specified character buffer.

- virtual **lang::CharSequence * subSequence** (int start, int end) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

- virtual **CharBuffer * slice** () const =0

*Creates a new **CharBuffer** (p. 1148) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **CharBuffer** &value) const

- virtual bool **equals** (const **CharBuffer** &value) const

- virtual bool **operator==** (const **CharBuffer** &value) const

- virtual bool **operator**< (const **CharBuffer** &value) const

Static Public Member Functions

- static **CharBuffer** * **allocate** (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Allocates a new character buffer.
- static **CharBuffer** * **wrap** (char *array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Wraps the passed buffer with a new **CharBuffer** (p. 1148).*
- static **CharBuffer** * **wrap** (std::vector< char > &buffer)
*Wraps the passed STL char Vector in a **CharBuffer** (p. 1148).*

Protected Member Functions

- **CharBuffer** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **CharBuffer** (p. 1148) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.183.1 Detailed Description

This class defines four categories of operations upon character buffers: o Absolute and relative get and put methods that read and write single characters; o Relative bulk get methods that transfer contiguous sequences of characters from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of characters from a character array, a string, or some other character buffer into this buffer. o Methods for compacting, duplicating, and slicing a character buffer.

Character buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing character array or string into a buffer, or by creating a view of an existing byte buffer

This class implements the CharSequence interface so that character buffers may be used wherever character sequences are accepted, for example in the regular-expression package decaf.util.regex.

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained. The sequence of statements

```
cb.put("text/"); cb.put(subtype); cb.put("; charset="); cb.put(enc);
```

can, for example, be replaced by the single statement

```
cb.put("text").put(subtype).put("; charset=").put(enc);
```

6.183.2 Constructor & Destructor Documentation

6.183.2.1 `decaf::nio::CharBuffer::CharBuffer (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)` [protected]

Creates a **CharBuffer** (p. 1148) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size of the array, this is the limit we read and write to.
-----------------	--

Exceptions

<i>IllegalArgumentException</i>	if capacity is negative.
---------------------------------	--------------------------

6.183.2.2 `virtual decaf::nio::CharBuffer::~~CharBuffer ()` [inline, virtual]

6.183.3 Member Function Documentation

6.183.3.1 `static CharBuffer* decaf::nio::CharBuffer::allocate (int capacity) throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [static]

Allocates a new character buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

<i>capacity</i>	The size of the Char buffer in chars (1 byte).
-----------------	--

Returns

the **CharBuffer** (p. 1148) that was allocated, caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if capacity is negative.
----------------------------------	--------------------------

6.183.3.2 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value*, int *start*, int *end*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, BufferOverflowException, ReadOnlyBufferException) [virtual]

Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.

Parameters

<i>value</i>	The CharSequence to append.
<i>start</i>	The index to start appending from.
<i>end</i>	The index to append to.

Returns

a reference to this modified **CharBuffer** (p. 1148).

Exceptions

BufferOverflowException (p. 964)	if there is no more space
ReadOnlyBufferException (p. 3260)	if this Buffer (p. 936) is read only.
IndexOutOfBoundsException	if start > end, or > length of sequence.

Implements **decaf::lang::Appendable** (p. 734).

6.183.3.3 CharBuffer& decaf::nio::CharBuffer::append (char *value*) throw (BufferOverflowException, ReadOnlyBufferException) [virtual]

Appends the specified character to this buffer.

Parameters

<i>value</i>	The char to append.
--------------	---------------------

Returns

a reference to this modified **CharBuffer** (p. 1148).

Exceptions

BufferOverflowException (p. 964)	if there is no more space
ReadOnlyBufferException (p. 3260)	if this Buffer (p. 936) is read only.

Implements **decaf::lang::Appendable** (p. 734).

**6.183.3.4 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence *
value) throw (BufferOverflowException, ReadOnlyBufferException)
[virtual]**

Appends the specified character sequence to this buffer.

If value is Null the the string "null" is appended to the buffer.

Parameters

<i>value</i>	The CharSequence to append.
--------------	-----------------------------

Returns

a reference to this modified **CharBuffer** (p. 1148)

Exceptions

BufferOverflowEx- ception (p. 964)	if there is no more space
ReadOnlyBufferEx- ception (p. 3260)	if this Buffer (p. 936) is read only.

Implements **decaf::lang::Appendable** (p. 735).

**6.183.3.5 virtual char* decaf::nio::CharBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException,
ReadOnlyBufferException) [pure virtual]**

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 936).

Exceptions

ReadOnlyBufferEx- ception (p. 3260)	if this Buffer (p. 936) is read only.
UnsupportedOpera- tionException	if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1141).

6.183.3.6 `virtual int decaf::nio::CharBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)` [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this Buffer (p. 936) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1142).

6.183.3.7 `virtual CharBuffer* decaf::nio::CharBuffer::asReadOnlyBuffer () const` [pure virtual]

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1142).

6.183.3.8 `char decaf::nio::CharBuffer::charAt (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Reads the character at the given index relative to the current position.

Parameters

<i>index</i>	- The index of the character to be read relative to position
--------------	--

Returns

The character at index **position()** (p. 941) + index.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index + the current position exceeds the size of the buffer or the index is negative.
----------------------------------	--

Implements **decaf::lang::CharSequence** (p. 1168).

6.183.3.9 `virtual CharBuffer& decaf::nio::CharBuffer::compact () throw (ReadOnlyBufferException)` [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 1148).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	- If this buffer is read-only
---	-------------------------------

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1143).

6.183.3.10 `virtual int decaf::nio::CharBuffer::compareTo (const CharBuffer & value) const`
[virtual]

6.183.3.11 `virtual CharBuffer* decaf::nio::CharBuffer::duplicate ()` [pure
virtual]

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 936) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1143).

6.183.3.12 `virtual bool decaf::nio::CharBuffer::equals (const CharBuffer & value) const`
[virtual]

6.183.3.13 `virtual char decaf::nio::CharBuffer::get () throw (BufferUnderflowException)`
[pure virtual]

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there no more data to return
--	---------------------------------

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1144).

6.183.3.14 `virtual char decaf::nio::CharBuffer::get (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [pure
virtual]

Absolute get method.

Reads the char at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the char is to be read.
--------------	---

Returns

the char that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit or is negative.
----------------------------------	---

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1144).

6.183.3.15 **CharBuffer& decaf::nio::CharBuffer::get (std::vector< char > *buffer*) throw (BufferUnderflowException)**

Relative bulk get method.

This method transfers chars from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **CharBuffer** (p. 1148).

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are fewer than length chars remaining in this buffer.
---	--

6.183.3.16 **CharBuffer& decaf::nio::CharBuffer::get (char * *buffer*, int *size*, int *offset*, int *length*) throw (BufferUnderflowException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)**

Relative bulk get method.

This method transfers chars from this buffer into the given destination array. If there are fewer chars remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 941), then no bytes are transferred and a **BufferUnderflowException** (p. 967) is thrown.

Otherwise, this method copies length chars from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

<i>buffer</i>	The pointer to an allocated buffer to fill.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 936).

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there are fewer than length chars remaining in this buffer
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.183.3.17 `virtual bool decaf::nio::CharBuffer::hasArray () const` [pure virtual]

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1145).

6.183.3.18 `int decaf::nio::CharBuffer::length () const` [inline, virtual]

Returns the length of this character buffer.

Returns

the length of this buffer from the position to the limit.

Implements **decaf::lang::CharSequence** (p. 1168).

6.183.3.19 `virtual bool decaf::nio::CharBuffer::operator< (const CharBuffer & value) const`
[virtual]

6.183.3.20 `virtual bool decaf::nio::CharBuffer::operator== (const CharBuffer & value) const`
[virtual]

6.183.3.21 `CharBuffer& decaf::nio::CharBuffer::put (CharBuffer & src)`
`throw (BufferOverflowException, ReadOnlyBufferException,`
`decaf::lang::exceptions::IllegalArgumentException)`

This method transfers the chars remaining in the given source buffer into this buffer.

If there are more chars remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 941), then no chars are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies `n = src.remaining()` chars from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

<i>src</i>	- the buffer to take chars from an place in this one.
------------	---

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	if there is insufficient space in this buffer for the remaining chars in the source buffer.
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only.

6.183.3.22 `CharBuffer& decaf::nio::CharBuffer::put (const char * buffer, int size, int offset,`
`int length) throw (BufferOverflowException, ReadOnlyBufferException,`
`decaf::lang::exceptions::IndexOutOfBoundsException,`
`decaf::lang::exceptions::NullPointerException)`

This method transfers chars into this buffer from the given source array.

If there are more chars to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 941), then no chars are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of

this buffer is then incremented by length.

Parameters

<i>buffer</i>	The array from which chars are to be read.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The offset within the array of the first char to be read.
<i>length</i>	The number of chars to be read from the given array.

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there is insufficient space in this buffer
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.183.3.23 `virtual CharBuffer& decaf::nio::CharBuffer::put (char value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The char value to be written.
--------------	-------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not smaller than its limit
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1145).

6.183.3.24 `virtual CharBuffer& decaf::nio::CharBuffer::put (int index, char value)
throw (decaf::lang::exceptions::IndexOutOfBoundsException,
ReadOnlyBufferException) [pure virtual]`

Writes the given char into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The char to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1146).

6.183.3.25 `CharBuffer& decaf::nio::CharBuffer::put (std::string & src, int start, int
end) throw (BufferOverflowException, ReadOnlyBufferException,
decaf::lang::exceptions::IndexOutOfBoundsException)`

Relative bulk put method (optional operation).

This method transfers characters from the given string into this buffer. If there are more characters to be copied from the string than remain in this buffer, that is, if `end - start > remaining()` (p. 941), then no characters are transferred and a **BufferOverflowException** (p. 964) is thrown.

Returns

a reference to this buffer

Otherwise, this method copies `n = end - start` characters from the given string into this buffer, starting at the given start index and at the current position of this buffer. The position of this buffer is then incremented by `n`.

Parameters

<i>src</i>	The string to copy from.
<i>start</i>	The position in <i>src</i> to start from.
<i>end</i>	The position in <i>src</i> to stop at.

Returns

a reference to this **CharBuffer** (p. 1148).

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not
<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only

6.183.3.26 CharBuffer& decaf::nio::CharBuffer::put (const std::string & src) throw (BufferOverflowException, ReadOnlyBufferException)

Relative bulk put method (optional operation).

This method transfers the entire content of the given source string into this buffer. An invocation of this method of the form dst.put(s) behaves in exactly the same way as the invocation.

Parameters

<i>src</i>	The string to copy from.
------------	--------------------------

Returns

a reference to this **CharBuffer** (p. 1148).

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

6.183.3.27 CharBuffer& decaf::nio::CharBuffer::put (std::vector< char > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source char array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size()).

Parameters

<i>buffer</i>	The buffer whose contents are copied to this CharBuffer (p. 1148).
---------------	---

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there is insufficient space in this buffer.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

```
6.183.3.28 virtual int decaf::nio::CharBuffer::read ( CharBuffer * target )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
ReadOnlyBufferException ) [virtual]
```

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

<i>target</i>	The buffer to read characters into
---------------	------------------------------------

Returns

The number of characters added to the buffer, or string::npos if this source of characters is at its end

Exceptions

<i>NullPointerException</i>	if target is Null.
<i>IllegalArgumentException</i>	if target is this CharBuffer (p. 1148).
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is in read-only mode.

```
6.183.3.29 virtual CharBuffer* decaf::nio::CharBuffer::slice ( ) const [pure
virtual]
```

Creates a new **CharBuffer** (p. 1148) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers'

position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 1148) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1146).

6.183.3.30 `virtual lang::CharSequence* decaf::nio::CharBuffer::subSequence (int start, int end) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 941) + start, and its limit will be **position()** (p. 941) + end. The new **Buffer** (p. 936) will be read-only if, and only if, this buffer is read-only.

Parameters

<i>start</i>	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than remaining() (p. 941).
<i>end</i>	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than remaining() (p. 941).

Returns

The new character buffer, caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions on start and end fail.
----------------------------------	---

Implements **decaf::lang::CharSequence** (p. 1168).

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1147).

6.183.3.31 `virtual std::string decaf::nio::CharBuffer::toString () const [virtual]`

Returns

a std::string describing this object

Implements **decaf::lang::CharSequence** (p. 1169).

6.183.3.32 `static CharBuffer* decaf::nio::CharBuffer::wrap (char * array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)` [static]

Wraps the passed buffer with a new **CharBuffer** (p. 1148).

The new buffer will be backed by the given char array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>array</i>	The array that will back the new buffer.
<i>size</i>	The size of the array passed in.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new **CharBuffer** (p. 1148) that is backed by buffer, caller owns.

Exceptions

<i>NullPointerException</i>	if the array pointer is Null.
<i>IndexOutOfBoundsException</i>	if capacity is negative.

6.183.3.33 `static CharBuffer* decaf::nio::CharBuffer::wrap (std::vector< char > & buffer)` [static]

Wraps the passed STL char Vector in a **CharBuffer** (p. 1148).

The new buffer will be backed by the given char array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new **CharBuffer** (p. 1148) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/CharBuffer.h`

6.184 decaf::lang::CharSequence Class Reference

A **CharSequence** (p. 1167) is a readable sequence of char values.

```
#include <src/main/decaf/lang/CharSequence.h>
```

Inheritance diagram for decaf::lang::CharSequence:

Public Member Functions

- virtual **~CharSequence** ()
- virtual int **length** () const =0
- virtual char **charAt** (int index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

- virtual **CharSequence** * **subSequence** (int start, int end) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

*Returns a new **CharSequence** (p. 1167) that is a subsequence of this sequence.*

- virtual std::string **toString** () const =0

6.184.1 Detailed Description

A **CharSequence** (p. 1167) is a readable sequence of char values. This interface provides uniform, read-only access to many different kinds of char sequences.

This interface does not define that a **CharSequence** (p. 1167) should implement comparable, it is therefore up to the derived classes that implement this interface to define equality, which implies that comparison of two CharSequences does not have a contract on equality.

6.184.2 Constructor & Destructor Documentation

6.184.2.1 `virtual decaf::lang::CharSequence::~~CharSequence () [inline, virtual]`

6.184.3 Member Function Documentation

6.184.3.1 `virtual char decaf::lang::CharSequence::charAt (int index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

<i>index</i>	- position to return the char at.
--------------	-----------------------------------

Returns

the char at the given position

Exceptions

<i>IndexOutOfBoundsException</i>	if index is > than length() (p. 1168) or negative
----------------------------------	--

Implemented in **decaf::lang::String** (p. 3777), and **decaf::nio::CharBuffer** (p. 1156).

6.184.3.2 `virtual int decaf::lang::CharSequence::length () const [pure virtual]`

Returns

the length of the underlying character sequence.

Implemented in **decaf::lang::String** (p. 3778), and **decaf::nio::CharBuffer** (p. 1159).

6.184.3.3 `virtual CharSequence* decaf::lang::CharSequence::subSequence (int start, int end) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Returns a new **CharSequence** (p. 1167) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters

<i>start</i>	- the start index, inclusive
<i>end</i>	- the end index, exclusive

Returns

a new **CharSequence** (p. 1167)

Exceptions

<i>IndexOutOfBoundsException</i>	if start or end > length() (p. 1168) or start or end are negative.
----------------------------------	---

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 1147), **decaf::lang::String** (p. 3778), and **decaf::nio::CharBuffer** (p. 1165).

6.184.3.4 `virtual std::string decaf::lang::CharSequence::toString () const` [pure virtual]

Returns

the string representation of this **CharSequence** (p. 1167)

Implemented in **decaf::lang::String** (p. 3778), and **decaf::nio::CharBuffer** (p. 1165).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/CharSequence.h`

6.185 decaf::util::zip::CheckedInputStream Class Reference

An implementation of a **FilterInputStream** that will maintain a **Checksum** (p. 1174) of the bytes read, the **Checksum** (p. 1174) can then be used to verify the integrity of the input stream.

```
#include <src/main/decaf/util/zip/CheckedInputStream.h>
```

Inheritance diagram for **decaf::util::zip::CheckedInputStream**:

Public Member Functions

- **CheckedInputStream** (**InputStream** ***inputStream**, **Checksum** ***sum**, bool **own**=false)

*Create a new instance of a **CheckedInputStream** (p. 1169).*

- virtual **~CheckedInputStream** ()
- **Checksum** * **getChecksum** () const

*Returns a Pointer to the **Checksum** (p. 1174) that is in use by this **CheckedInputStream** (p. 1169).*

- virtual long long **skip** (long long num) throw (decaf::io::IOException)

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

*The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num	The number of bytes to skip.
-----	------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 2210)	<i>if an I/O error occurs.</i>
UnsupportedOperationException	<i>if the concrete stream class does not support skipping bytes.</i>

Protected Member Functions

- virtual int **doReadByte** () throw (decaf::io::IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

6.185.1 Detailed Description

An implementation of a **FilterInputStream** that will maintain a **Checksum** (p. 1174) of the bytes read, the **Checksum** (p. 1174) can then be used to verify the integrity of the input stream.

Since

1.0

6.185.2 Constructor & Destructor Documentation

- 6.185.2.1 decaf::util::zip::CheckedInputStream::CheckedInputStream (**InputStream** * *inputStream*, **Checksum** * *sum*, bool *own* = false)

Create a new instance of a **CheckedInputStream** (p. 1169).

Parameters

<i>inputStream</i>	The InputStream instance to Wrap.
<i>sum</i>	The Checksum (p. 1174) instance to use (does not take ownership of the Pointer).
<i>own</i>	Indicates if this filer should take ownership of the InputStream .

Exceptions

<i>NullPointerException</i>	if the Checksum (p. 1174) pointer is NULL.
-----------------------------	---

6.185.2.2 virtual decaf::util::zip::ChecksumInputStream::~ChecksumInputStream ()
[virtual]

6.185.3 Member Function Documentation

6.185.3.1 virtual int decaf::util::zip::ChecksumInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1954).

6.185.3.2 virtual int decaf::util::zip::ChecksumInputStream::doReadByte () throw (decaf::io::IOException) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1954).

6.185.3.3 Checksum* decaf::util::zip::ChecksumInputStream::getChecksum () const
[inline]

Returns a Pointer to the **Checksum** (p. 1174) that is in use by this **ChecksumInputStream** (p. 1169).

Returns

the pointer to the **Checksum** (p. 1174) instance that is in use by this object.

6.185.3.4 virtual long long decaf::util::zip::ChecksumInputStream::skip (long long *num*) throw (decaf::io::IOException) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error occurs.
<i>UnsupportedOperationException</i>	if the concrete stream class does not support skipping bytes.

Adds the skipped bytes into the **Checksum** (p. 1174).

Reimplemented from **decaf::io::FilterInputStream** (p. 1956).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**CheckedInputStream.h**

6.186 decaf::util::zip::CheckedOutputStream Class Reference

An implementation of a **FilterOutputStream** that will maintain a **Checksum** (p. 1174) of the bytes written, the **Checksum** (p. 1174) can then be used to verify the integrity of the output stream.

```
#include <src/main/decaf/util/zip/CheckedOutputStream.h>
```

Inheritance diagram for **decaf::util::zip::CheckedOutputStream**:

Public Member Functions

- **CheckedOutputStream** (**decaf::io::OutputStream** *outputStream, **Checksum** *sum, bool own=false)

Create a new instance of a **CheckedOutputStream** (p. 1172).

- virtual **~CheckedOutputStream** ()
- **Checksum** * **getChecksum** () const

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value) throw (**decaf::io::IOException**)

- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

6.186.1 Detailed Description

An implementation of a `FilterOutputStream` that will maintain a **Checksum** (p. 1174) of the bytes written, the **Checksum** (p. 1174) can then be used to verify the integrity of the output stream.

Since

1.0

6.186.2 Constructor & Destructor Documentation

6.186.2.1 decaf::util::zip::CheckedOutputStream::CheckedOutputStream (decaf::io::OutputStream * *outputStream*, Checksum * *sum*, bool *own* = false)

Create a new instance of a **CheckedOutputStream** (p. 1172).

Parameters

<i>output-Stream</i>	The <code>OutputStream</code> instance to Wrap.
<i>sum</i>	The Checksum (p. 1174) instance to use (does not take ownership of the Pointer).
<i>own</i>	Indicates if this filer should take ownership of the <code>InputStream</code> .

Exceptions

<i>NullPointerException</i>	if the Checksum (p. 1174) pointer is NULL.
-----------------------------	---

6.186.2.2 virtual decaf::util::zip::CheckedOutputStream::~CheckedOutputStream ()
[virtual]

6.186.3 Member Function Documentation

6.186.3.1 virtual void decaf::util::zip::CheckedOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
[protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1960).

6.186.3.2 `virtual void decaf::util::zip::CheckedOutputStream::doWriteByte (unsigned char value) throw (decaf::io::IOException)` [protected, virtual]

Reimplemented from `decaf::io::FilterOutputStream` (p. 1960).

6.186.3.3 `Checksum* decaf::util::zip::CheckedOutputStream::getChecksum () const` [inline]

Returns

a pointer to the **Checksum** (p. 1174) instance in use by this object.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/zip/CheckedOutputStream.h`

6.187 decaf::util::zip::Checksum Class Reference

An interface used to represent **Checksum** (p. 1174) values in the Zip package.

```
#include <src/main/decaf/util/zip/Checksum.h>
```

Inheritance diagram for `decaf::util::zip::Checksum`:

Public Member Functions

- `virtual ~Checksum ()`
- `virtual long long getValue () const =0`
- `virtual void reset ()=0`
Reset the checksum to its initial value.
- `virtual void update (const std::vector< unsigned char > &buffer)=0`
Updates the current checksum with the specified vector of bytes.
- `virtual void update (const std::vector< unsigned char > &buffer, int offset, int length)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
Updates the current checksum with the specified array of bytes.
- `virtual void update (const unsigned char *buffer, int size, int offset, int length)=0 throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`
Updates the current checksum with the specified array of bytes.
- `virtual void update (int byte)=0`
Updates the current checksum with the specified byte value.

6.187.1 Detailed Description

An interface used to represent **Checksum** (p. 1174) values in the Zip package.

Since

1.0

6.187.2 Constructor & Destructor Documentation

6.187.2.1 virtual decaf::util::zip::Checksum::~Checksum () [inline, virtual]

6.187.3 Member Function Documentation

6.187.3.1 virtual long long decaf::util::zip::Checksum::getValue () const [pure virtual]

Returns

the current checksum value.

Implemented in **decaf::util::zip::Adler32** (p. 731), and **decaf::util::zip::CRC32** (p. 1569).

6.187.3.2 virtual void decaf::util::zip::Checksum::reset () [pure virtual]

Reset the checksum to its initial value.

Implemented in **decaf::util::zip::Adler32** (p. 731), and **decaf::util::zip::CRC32** (p. 1569).

6.187.3.3 virtual void decaf::util::zip::Checksum::update (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>size</i>	The size of the passed buffer.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>NullPointerException</i>	if the passed buffer is NULL.
<i>IndexOutOfBoundsException</i>	if offset + length > size of the buffer.

Implemented in **decaf::util::zip::Adler32** (p. 731), and **decaf::util::zip::CRC32** (p. 1569).

6.187.3.4 `virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if offset + length > size of the buffer.
----------------------------------	--

Implemented in **decaf::util::zip::Adler32** (p. 732), and **decaf::util::zip::CRC32** (p. 1570).

6.187.3.5 `virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & buffer) [pure virtual]`

Updates the current checksum with the specified vector of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
---------------	--

Implemented in **decaf::util::zip::Adler32** (p. 732), and **decaf::util::zip::CRC32** (p. 1570).

6.187.3.6 `virtual void decaf::util::zip::Checksum::update (int byte) [pure virtual]`

Updates the current checksum with the specified byte value.

Parameters

<i>byte</i>	The byte value to update the current Checksum (p. 1174) with (0..255).
-------------	---

Implemented in **decaf::util::zip::Adler32** (p. 732), and **decaf::util::zip::CRC32** (p. 1570).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/zip/Checksum.h`

6.188 decaf::lang::exceptions::ClassCastException Class Reference

```
#include <src/main/decaf/lang/exceptions/ClassCastException.h>
```

Inheritance diagram for decaf::lang::exceptions::ClassCastException:

Public Member Functions

- **ClassCastException** () throw ()
Default Constructor.
- **ClassCastException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1886).*
- **ClassCastException** (const **ClassCastException** &ex) throw ()
Copy Constructor.
- **ClassCastException** (const std::exception *cause) throw ()
Constructor.
- **ClassCastException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ClassCastException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ClassCastException** * **clone** () const
Clones this exception.
- virtual ~**ClassCastException** () throw ()

6.188.1 Constructor & Destructor Documentation

6.188.1.1 decaf::lang::exceptions::ClassCastException::ClassCastException () throw ()
[inline]

Default Constructor.

6.188.1.2 decaf::lang::exceptions::ClassCastException::ClassCastException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1886).

Parameters

<i>ex</i>	The Exception (p. 1886) whose data is to be copied into this one.
-----------	--

6.188.1.3 `decaf::lang::exceptions::ClassCastException::ClassCastException (const
ClassCastException & ex) throw () [inline]`

Copy Constructor.

Parameters

<i>ex</i>	The Exception (p. 1886) whose data is to be copied into this one.
-----------	--

6.188.1.4 `decaf::lang::exceptions::ClassCastException::ClassCastException (const
std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer (p. 3032) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	---

6.188.1.5 `decaf::lang::exceptions::ClassCastException::ClassCastException (const char * file,
const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.188.1.6 `decaf::lang::exceptions::ClassCastException::ClassCastException (const char * file,
const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()
[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
-------------	--------------------------------------

<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.188.1.7 `virtual decaf::lang::exceptions::ClassCastException::~~ClassCastException () throw
() [inline, virtual]`

6.188.2 Member Function Documentation

6.188.2.1 `virtual ClassCastException* decaf::lang::exceptions::ClassCastException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1886) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1889).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/ClassCastException.h`

6.189 cms::Closeable Class Reference

Interface for a class that implements the close method.

```
#include <src/main/cms/Closeable.h>
```

Inheritance diagram for cms::Closeable:

Public Member Functions

- `virtual ~Closeable ()`
- `virtual void close ()=0 throw (CMSException)`

Closes this object and deallocates the appropriate resources.

6.189.1 Detailed Description

Interface for a class that implements the close method. A class that implements this interface should release all resources upon the close call and should throw an exception from any methods that require those resources after they have been closed.

Since

1.0

6.189.2 Constructor & Destructor Documentation

6.189.2.1 `virtual cms::Closeable::~~Closeable () [inline, virtual]`

6.189.3 Member Function Documentation

6.189.3.1 `virtual void cms::Closeable::close () throw (CMSException) [pure virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>CMSException</i> (p. 1190)	- If an error occurs while the resource is being closed.
---	--

Implemented in `activemq::cmsutil::CachedConsumer` (p. 1099), `activemq::cmsutil::CachedProducer` (p. 1103), `activemq::cmsutil::PooledSession` (p. 3045), `activemq::commands::ActiveMQTempDestination` (p. 580), `activemq::core::ActiveMQConnection` (p. 267), `activemq::core::ActiveMQConsumer` (p. 304), `activemq::core::ActiveMQProducer` (p. 468), `activemq::core::ActiveMQQueueBrowser` (p. 484), `activemq::core::ActiveMQSession` (p. 518), `cms::Connection` (p. 1298), and `cms::Session` (p. 3464).

The documentation for this class was generated from the following file:

- `src/main/cms/Closeable.h`

6.190 decaf::io::Closeable Class Reference

Interface for a class that implements the close method.

```
#include <src/main/decaf/io/Closeable.h>
```

Inheritance diagram for `decaf::io::Closeable`:

Public Member Functions

- virtual `~Closeable()`
- virtual void `close()` throw (`io::IOException`)

Closes this object and deallocates the appropriate resources.

6.190.1 Detailed Description

Interface for a class that implements the close method.

6.190.2 Constructor & Destructor Documentation

6.190.2.1 virtual `decaf::io::Closeable::~~Closeable()` [`inline`, `virtual`]

6.190.3 Member Function Documentation

6.190.3.1 virtual void `decaf::io::Closeable::close()` throw (`io::IOException`) [`pure virtual`]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>IOException</i> (p. 2210)	if an error occurs while closing.
--	-----------------------------------

Implemented in `activemq::transport::correlator::ResponseCorrelator` (p. 3386), `activemq::transport::failover::FailoverTransport` (p. 1934), `activemq::transport::inactivity::InactivityMonitor` (p. 2067), `activemq::transport::IOTransport` (p. 2215), `activemq::transport::mock::MockTransport` (p. 2857), `activemq::transport::tcp::TcpTransport` (p. 3867), `activemq::transport::TransportFilter` (p. 4007), `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2987), `decaf::internal::io::StandardErrorOutputStream` (p. 3687), `decaf::internal::io::StandardOutputStream` (p. 3690), `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2947), `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2968), `decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream` (p. 2970), `decaf::internal::net::tcp::TcpSocketInputStream` (p. 3862), `decaf::internal::net::tcp::TcpSocketOutputStream` (p. 3864), `decaf::io::BlockingByteArrayInputStream` (p. 847), `decaf::io::BufferedInputStream` (p. 946), `decaf::io::FilterInputStream` (p. 1954), `decaf::io::FilterOutputStream` (p. 1959), `decaf::io::InputStream` (p. 2108), `decaf::io::InputStreamReader` (p. 2118), `decaf::io::OutputStream` (p. 2993), `decaf::io::OutputStreamWriter` (p. 3001), `decaf::net::Socket` (p. 3614), `decaf::util::logging::ConsoleHandler` (p. 1440), `decaf::util::logging::StreamHandler` (p. 3758), `decaf::util::zip::DeflaterOutputStream` (p. 1772), and `decaf::util::zip::InflaterInputStream` (p. 2102).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/Closeable.h`

6.191 activemq::transport::failover::CloseTransportsTask Class Reference

```
#include <src/main/activemq/transport/failover/CloseTransportsTask.h>
```

Inheritance diagram for `activemq::transport::failover::CloseTransportsTask`:

Public Member Functions

- **CloseTransportsTask** ()
- virtual **~CloseTransportsTask** ()
- void **add** (const **Pointer**< **Transport** > &transport)
*Add a new **Transport** (p. 3996) to close.*
- virtual bool **isPending** () const
This Task is pending if there are transports in the Queue that need to be closed.
- virtual bool **iterate** ()
Return true until all transports have been closed and removed from the queue.

6.191.1 Constructor & Destructor Documentation

6.191.1.1 `activemq::transport::failover::CloseTransportsTask::CloseTransportsTask ()`

6.191.1.2 `virtual activemq::transport::failover::CloseTransportsTask::~~CloseTransportsTask ()` [virtual]

6.191.2 Member Function Documentation

6.191.2.1 `void activemq::transport::failover::CloseTransportsTask::add (const Pointer< Transport > & transport)`

Add a new **Transport** (p. 3996) to close.

6.191.2.2 `virtual bool activemq::transport::failover::CloseTransportsTask::isPending ()` const [virtual]

This Task is pending if there are transports in the Queue that need to be closed.

Returns

true if there is a transport in the queue that needs closed.

Implements `activemq::threads::CompositeTask` (p. 1255).

6.191.2.3 `virtual bool activemq::transport::failover::CloseTransportsTask::iterate ()`
`[virtual]`

Return true until all transports have been closed and removed from the queue.

Implements **activemq::threads::Task** (p. 3847).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/failover/CloseTransportsTask.h`

6.192 activemq::cmsutil::CmsAccessor Class Reference

Base class for **activemq.cmsutil.CmsTemplate** (p. 1201) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1361) to operate on.

```
#include <src/main/activemq/cmsutil/CmsAccessor.h>
```

Inheritance diagram for `activemq::cmsutil::CmsAccessor`:

Public Member Functions

- **CmsAccessor** ()
- `virtual ~CmsAccessor` ()
- `virtual ResourceLifecycleManager * getResourceLifecycleManager` ()
- `virtual const ResourceLifecycleManager * getResourceLifecycleManager` ()
const
- `virtual void setConnectionFactory` (`cms::ConnectionFactory *connectionFactory`)

Set the ConnectionFactory to use for obtaining CMS Connections.

- `virtual const cms::ConnectionFactory * getConnectionFactory` () const
Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

- `virtual cms::ConnectionFactory * getConnectionFactory` ()
Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

- `virtual void setSessionAcknowledgeMode` (`cms::Session::AcknowledgeMode sessionAcknowledgeMode`)
Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.

- `virtual cms::Session::AcknowledgeMode getSessionAcknowledgeMode` () const

Return the acknowledgment mode for CMS sessions.

Protected Member Functions

- **CmsAccessor** (const **CmsAccessor** &)
- **CmsAccessor** & **operator=** (const **CmsAccessor** &)
- virtual void **init** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Initializes this object and prepares it for use.
- virtual void **destroy** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Shuts down this object and destroys any allocated resources.
- virtual **cms::Connection** * **createConnection** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Create a CMS Connection via this template's ConnectionFactory.
- virtual **cms::Session** * **createSession** (**cms::Connection** *con) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Create a CMS Session for the given Connection.
- virtual void **checkConnectionFactory** () throw (decaf::lang::exceptions::IllegalStateException)
Verifies that the connection factory is valid.

6.192.1 Detailed Description

Base class for **activemq.cmsutil.CmsTemplate** (p. 1201) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1361) to operate on. The subclass **activemq.cmsutil.CmsDestinationAccessor** (p. 1187) adds further, destination-related properties.

Not intended to be used directly.

activemq.cmsutil.CmsTemplate (p. 1201)

6.192.2 Constructor & Destructor Documentation

6.192.2.1 `activemq::cmsutil::CmsAccessor::CmsAccessor (const CmsAccessor &)`
[inline, protected]

6.192.2.2 `activemq::cmsutil::CmsAccessor::CmsAccessor ()`

6.192.2.3 `virtual activemq::cmsutil::CmsAccessor::~~CmsAccessor ()` [virtual]

6.192.3 Member Function Documentation

6.192.3.1 `virtual void activemq::cmsutil::CmsAccessor::checkConnectionFactory () throw (decaf::lang::exceptions::IllegalStateException)` [protected, virtual]

Verifies that the connection factory is valid.

6.192.3.2 `virtual cms::Connection* activemq::cmsutil::CmsAccessor::createConnection () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)`
[protected, virtual]

Create a CMS Connection via this template's ConnectionFactory.

Returns

the new CMS Connection

Exceptions

<i>cms::CMSException</i> (p. 1190)	if thrown by CMS API methods
---------------------------------------	------------------------------

6.192.3.3 `virtual cms::Session* activemq::cmsutil::CmsAccessor::createSession (cms::Connection * con) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)` [protected, virtual]

Create a CMS Session for the given Connection.

Parameters

<i>con</i>	the CMS Connection to create a Session for
------------	--

Returns

the new CMS Session

Exceptions

<i>cms::CMSException</i> (p. 1190)	if thrown by CMS API methods
--	------------------------------

6.192.3.4 `virtual void activemq::cmsutil::CmsAccessor::destroy () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)`
[inline, protected, virtual]

Shuts down this object and destroys any allocated resources.

Reimplemented in **activemq::cmsutil::CmsDestinationAccessor** (p. 1189), and **activemq::cmsutil::CmsTemplate** (p. 1205).

6.192.3.5 `virtual const cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () const` [inline, virtual]

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.192.3.6 `virtual cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory ()`
[inline, virtual]

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.192.3.7 `virtual ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager ()` [inline, virtual]

6.192.3.8 `virtual const ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () const`
[inline, virtual]

6.192.3.9 `virtual cms::Session::AcknowledgeMode activemq::cmsutil::CmsAccessor::getSessionAcknowledgeMode () const`
[inline, virtual]

Return the acknowledgment mode for CMS sessions.

Returns

the acknowledgment mode applied by this accessor

6.192.3.10 `virtual void activemq::cmsutil::CmsAccessor::init () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [inline, protected, virtual]`

Initializes this object and prepares it for use.

This should be called before any other methods are called. This version does nothing.

Reimplemented in **activemq::cmsutil::CmsDestinationAccessor** (p. 1189), and **activemq::cmsutil::CmsTemplate** (p. 1207).

6.192.3.11 `CmsAccessor& activemq::cmsutil::CmsAccessor::operator= (const CmsAccessor &) [inline, protected]`

6.192.3.12 `virtual void activemq::cmsutil::CmsAccessor::setConnectionFactory (cms::ConnectionFactory * connectionFactory) [inline, virtual]`

Set the ConnectionFactory to use for obtaining CMS Connections.

6.192.3.13 `virtual void activemq::cmsutil::CmsAccessor::setSessionAcknowledgeMode (cms::Session::AcknowledgeMode sessionAcknowledgeMode) [inline, virtual]`

Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.

Default is AUTO_ACKNOWLEDGE.

Parameters

<i>sessionAcknowledgeMode</i>	the acknowledgment mode
-------------------------------	-------------------------

The documentation for this class was generated from the following file:

[protected, virtual]

Resolves the destination via the **DestinationResolver** (p. 1810).

Parameters

<i>session</i>	the session
<i>destName</i>	the name of the destination.

Returns

the destination

Exceptions

<i>cms::CMSException</i> (p. 1190)	if resolution failed.
<i>decaf::lang::exceptions::IllegalStateException</i> (p. 2060)	if the destination resolver property is NULL.

- 6.193.3.9 `virtual void activemq::cmsutil::CmsDestinationAccessor::setDestinationResolver (DestinationResolver * destRes)` [inline, virtual]
- 6.193.3.10 `virtual void activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain (bool pubSubDomain)` [inline, virtual]

Reimplemented in **activemq::cmsutil::CmsTemplate** (p. 1214).

Referenced by **activemq::cmsutil::CmsTemplate::setPubSubDomain()**.

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CmsDestinationAccessor.h`

6.194 cms::CMSException Class Reference

CMS API Exception that is the base for all exceptions thrown from CMS classes.

```
#include <src/main/cms/CMSEException.h>
```

Inheritance diagram for cms::CMSEException:

Public Member Functions

- **CMSEException** () throw ()
- **CMSEException** (const **CMSEException** &ex) throw ()
- **CMSEException** (const std::string &message, const std::exception *cause) throw ()
- **CMSEException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**CMSEException** () throw ()
- virtual std::string **getMessage** () const
Gets the cause of the error.
- virtual const std::exception * **getCause** () const
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **setMark** (const char *file, const int lineNumber)
Adds a file/line number to the stack trace.
- virtual void **printStackTrace** () const
Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) const
Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () const
Gets the stack trace as one contiguous string.
- virtual const char * **what** () const throw ()
*Overloads the std::exception **what**() (p. 1194) function to return the cause of the exception.*

6.194.1 Detailed Description

CMS API Exception that is the base for all exceptions thrown from CMS classes. This class represents an error that has occurred in CMS, providers can wrap provider specific exceptions in this class by setting the cause to an instance of a provider specific exception provided it can be cast to an `std::exception`.

Since the contained cause exception is of type `std::exception` and the C++ exception class has no clone or copy method defined the contained exception can only be owned by one instance of an **CMSEException** (p. 1190). To that end the class hands off the exception to each successive copy so care must be taken when handling **CMSEException** (p. 1190) instances.

Since

1.0

6.194.2 Constructor & Destructor Documentation

6.194.2.1 `cms::CMSEException::CMSEException () throw ()`

6.194.2.2 `cms::CMSEException::CMSEException (const CMSEException & ex) throw ()`

6.194.2.3 `cms::CMSEException::CMSEException (const std::string & message, const std::exception * cause) throw ()`

6.194.2.4 `cms::CMSEException::CMSEException (const std::string & message, const std::exception * cause, const std::vector< std::pair< std::string, int > > & stackTrace) throw ()`

6.194.2.5 `virtual cms::CMSEException::~~CMSEException () throw ()` [virtual]

6.194.3 Member Function Documentation

6.194.3.1 `virtual const std::exception* cms::CMSEException::getCause () const` [virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

6.194.3.2 virtual std::string cms::CMSException::getMessage () const [virtual]

Gets the cause of the error.

Returns

string errors message

6.194.3.3 virtual std::vector< std::pair< std::string, int> > cms::CMSException::getStackTrace () const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

6.194.3.4 virtual std::string cms::CMSException::getStackTraceString () const [virtual]

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

6.194.3.5 virtual void cms::CMSException::printStackTrace () const [virtual]

Prints the stack trace to std::err.

6.194.3.6 virtual void cms::CMSException::printStackTrace (std::ostream & *stream*) const [virtual]

Prints the stack trace to the given output stream.

Parameters

<i>stream</i>	the target output stream.
---------------	---------------------------

6.194.3.7 virtual void cms::CMSException::setMark (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters

<i>file</i>	The name of the file calling this method (use <code>__FILE__</code>).
<i>lineNumber</i>	The line number in the calling file (use <code>__LINE__</code>).

6.194.3.8 `virtual const char* cms::CMSException::what () const throw ()` [virtual]

Overloads the `std::exception` **what()** (p. 1194) function to return the cause of the exception.

Returns

const char pointer to error message

6.196 cms::CMSProperties Class Reference

Interface for a Java-like properties object.

```
#include <src/main/cms/CMSProperties.h>
```

Inheritance diagram for cms::CMSProperties:

Public Member Functions

- `virtual ~CMSProperties ()`

- virtual bool **isEmpty** () const =0
Returns true if the properties object is empty.
- virtual const char * **getProperty** (const std::string &name) const =0
Looks up the value for the given property.
- virtual std::string **getProperty** (const std::string &name, const std::string &defaultValue) const =0
Looks up the value for the given property.
- virtual void **setProperty** (const std::string &name, const std::string &value)=0
Sets the value for a given property.
- virtual bool **hasProperty** (const std::string &name) const =0
Check to see if the Property exists in the set.
- virtual void **remove** (const std::string &name)=0
Removes the property with the given name.
- virtual std::vector< std::pair< std::string, std::string > > **toArray** () const =0
Method that serializes the contents of the property map to an array.
- virtual void **copy** (const **CMSPProperties** *source)=0
Copies the contents of the given properties object to this one.
- virtual **CMSPProperties** * **clone** () const =0
Clones this object.
- virtual void **clear** ()=0
Clears all properties from the map.
- virtual std::string **toString** () const =0
Formats the contents of the Properties Object into a string that can be logged, etc.

6.196.1 Detailed Description

Interface for a Java-like properties object. This is essentially a map of key-value string pairs.

Since

1.1

6.196.2 Constructor & Destructor Documentation

6.196.2.1 virtual cms::CMSProperties::~~CMSProperties () [inline, virtual]

6.196.3 Member Function Documentation

6.196.3.1 virtual void cms::CMSProperties::clear () [pure virtual]

Clears all properties from the map.

Implemented in **activemq::util::ActiveMQProperties** (p.476).

6.196.3.2 virtual CMSProperties* cms::CMSProperties::clone () const [pure virtual]

Clones this object.

Returns

a replica of this object.

Implemented in **activemq::util::ActiveMQProperties** (p.476).

6.196.3.3 virtual void cms::CMSProperties::copy (const CMSProperties * *source*) [pure virtual]

Copies the contents of the given properties object to this one.

Parameters

<i>source</i>	The source properties object.
---------------	-------------------------------

6.196.3.4 virtual const char* cms::CMSProperties::getProperty (const std::string & *name*) const [pure virtual]

Looks up the value for the given property.

Parameters

<i>name</i>	The name of the property to be looked up.
-------------	---

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implemented in **activemq::util::ActiveMQProperties** (p.477).

6.196.3.5 `virtual std::string cms::CMSProperties::getProperty (const std::string & name, const std::string & defaultValue) const` [pure virtual]

Looks up the value for the given property.

Parameters

<i>name</i>	the name of the property to be looked up.
<i>defaultValue</i>	The value to be returned if the given property does not exist.

Returns

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

Implemented in **activemq::util::ActiveMQProperties** (p. 477).

6.196.3.6 `virtual bool cms::CMSProperties::hasProperty (const std::string & name) const` [pure virtual]

Check to see if the Property exists in the set.

Parameters

<i>name</i>	the name of the property to check
-------------	-----------------------------------

Returns

true if property exists, false otherwise.

Implemented in **activemq::util::ActiveMQProperties** (p. 477).

6.196.3.7 `virtual bool cms::CMSProperties::isEmpty () const` [pure virtual]

Returns true if the properties object is empty.

Returns

true if empty

Implemented in **activemq::util::ActiveMQProperties** (p. 478).

6.196.3.8 `virtual void cms::CMSProperties::remove (const std::string & name)` [pure virtual]

Removes the property with the given name.

Parameters

<i>name</i>	the name of the property to be removed.s
-------------	--

Implemented in **activemq::util::ActiveMQProperties** (p. 478).

6.196.3.9 `virtual void cms::CMSProperties::setProperty (const std::string & name, const std::string & value) [pure virtual]`

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

<i>name</i>	The name of the value to be written.
<i>value</i>	The value to be written.

Implemented in **activemq::util::ActiveMQProperties** (p. 478).

6.196.3.10 `virtual std::vector< std::pair< std::string, std::string > > cms::CMSProperties::toArray () const [pure virtual]`

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

Implemented in **activemq::util::ActiveMQProperties** (p. 479).

6.196.3.11 `virtual std::string cms::CMSProperties::toString () const [pure virtual]`

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns

string value of this object.

Implemented in **activemq::util::ActiveMQProperties** (p. 479).

- virtual bool **isNoLocal** () const
- virtual void **setReceiveTimeout** (long long receiveTimeout)
- virtual long long **getReceiveTimeout** () const
- virtual void **setExplicitQosEnabled** (bool explicitQosEnabled)
Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.
- virtual bool **isExplicitQosEnabled** () const
If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message.
- virtual void **setDeliveryPersistent** (bool deliveryPersistent)
Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").
- virtual void **setDeliveryMode** (int deliveryMode)
Set the delivery mode to use when sending a message.
- virtual int **getDeliveryMode** () const
Return the delivery mode to use when sending a message.
- virtual void **setPriority** (int priority)
Set the priority of a message when sending.
- virtual int **getPriority** () const
Return the priority of a message when sending.
- virtual void **setTimeToLive** (long long timeToLive)
Set the time-to-live of the message when sending.
- virtual long long **getTimeToLive** () const
Return the time-to-live of the message when sending.
- virtual void **execute** (**SessionCallback** *action) throw (cms::CMSException)
Executes the given action within a CMS Session.
- virtual void **execute** (**ProducerCallback** *action) throw (cms::CMSException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **execute** (cms::Destination *dest, **ProducerCallback** *action) throw (cms::CMSException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **execute** (const std::string &destinationName, **ProducerCallback** *action) throw (cms::CMSException)
Executes the given action and provides it with a CMS Session and producer.

- virtual void **send** (**MessageCreator** *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the default destination.
- virtual void **send** (cms::Destination *dest, **MessageCreator** *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the specified destination.
- virtual void **send** (const std::string &destinationName, **MessageCreator** *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the specified destination.
- virtual **cms::Message** * **receive** () throw (cms::CMSEException)
Performs a synchronous read from the default destination.
- virtual **cms::Message** * **receive** (cms::Destination *destination) throw (cms::CMSEException)
Performs a synchronous read from the specified destination.
- virtual **cms::Message** * **receive** (const std::string &destinationName) throw (cms::CMSEException)
Performs a synchronous read from the specified destination.
- virtual **cms::Message** * **receiveSelected** (const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read consuming only messages identified by the given selector.
- virtual **cms::Message** * **receiveSelected** (cms::Destination *destination, const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.
- virtual **cms::Message** * **receiveSelected** (const std::string &destinationName, const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Static Public Attributes

- static const long long **RECEIVE_TIMEOUT_NO_WAIT**
Timeout value indicating that a receive operation should check if a message is immediately available without blocking.
- static const long long **RECEIVE_TIMEOUT_INDEFINITE_WAIT**

Timeout value indicating a blocking receive without timeout.

- static const int **DEFAULT_PRIORITY**

Default message priority.

- static const long long **DEFAULT_TIME_TO_LIVE**

My default, messages should live forever.

Protected Member Functions

- **CmsTemplate** (const **CmsTemplate** &)
- **CmsTemplate** & **operator=** (const **CmsTemplate** &)
- void **init** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Initializes this object and prepares it for use.
- void **destroy** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Clears all internal resources.

- class **ReceiveExecutor**
- class **ResolveReceiveExecutor**

6.198.1 Detailed Description

CmsTemplate (p. 1201) simplifies performing synchronous CMS operations. This class is intended to be for CMS what Spring's `JmsTemplate` is for JMS. Provided with a `CMS ConnectionFactory`, creates and manages all other CMS resources internally.

Before using **CmsTemplate** (p. 1201) the user must first set the destination (either by name or by setting the destination object directly) and then call `init` to initialize the object for use.

CmsTemplate (p. 1201) allows the user to get access to a `CMS Session` through a user-defined **SessionCallback** (p. 3475). Similarly, if the user wants direct access to a `CMS MessageProducer`, it can provide a **ProducerCallback** (p. 3154). As a convenience, the user can bypass having to provide callbacks altogether for sending messages, by calling one of the `send` methods.

SessionCallback (p. 3475)
ProducerCallback (p. 3154)
MessageCreator (p. 2677)

6.198.2 Constructor & Destructor Documentation

6.198.2.1 `activemq::cmsutil::CmsTemplate::CmsTemplate (const CmsTemplate &)`
`[inline, protected]`

6.198.2.2 `activemq::cmsutil::CmsTemplate::CmsTemplate ()`

6.198.2.3 `activemq::cmsutil::CmsTemplate::CmsTemplate (cms::ConnectionFactory * connectionFactory)`

6.198.2.4 `virtual activemq::cmsutil::CmsTemplate::~~CmsTemplate ()` `[virtual]`

6.198.3 Member Function Documentation

6.198.3.1 `void activemq::cmsutil::CmsTemplate::destroy () throw (cms::CMSEException, decaf::lang::exceptions::IllegalStateException)` `[protected, virtual]`

Clears all internal resources.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 1189).

6.198.3.2 `virtual void activemq::cmsutil::CmsTemplate::execute (SessionCallback * action) throw (cms::CMSEException)` `[virtual]`

Executes the given action within a CMS Session.

Parameters

<i>action</i>	the action to perform within a CMS Session
---------------	--

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs.
--	----------------------------

6.198.3.3 `virtual void activemq::cmsutil::CmsTemplate::execute (ProducerCallback * action) throw (cms::CMSEException)` `[virtual]`

Executes the given action and provides it with a CMS Session and producer.

Parameters

<i>action</i>	the action to perform
---------------	-----------------------

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs.
---	----------------------------

6.198.3.4 `virtual void activemq::cmsutil::CmsTemplate::execute (cms::Destination * dest,
ProducerCallback * action) throw (cms::CMSEException)` [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

<i>dest</i>	the destination to send messages to
<i>action</i>	the action to perform

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs.
---	----------------------------

6.198.3.5 `virtual void activemq::cmsutil::CmsTemplate::execute (const std::string &
destinationName, ProducerCallback * action) throw (cms::CMSEException)`
[virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

<i>destination-Name</i>	the name of the destination to send messages to (to internally be resolved to an actual destination)
<i>action</i>	the action to perform

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs.
---	----------------------------

6.198.3.6 `virtual cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination ()` [inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Non-const version of this method.

6.198.3.7 `virtual const cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () const`
[inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Const version of this method.

6.198.3.8 `virtual const std::string activemq::cmsutil::CmsTemplate::getDefaultDestinationName () const` [inline, virtual]

Gets the name of the default destination to be used for send/receive operations.

The destination type (topic/queue) is determined by the `pubSubDomain` property.

Returns

the default name of the destination for send/receive operations.

6.198.3.9 `virtual int activemq::cmsutil::CmsTemplate::getDeliveryMode () const`
[inline, virtual]

Return the delivery mode to use when sending a message.

6.198.3.10 `virtual int activemq::cmsutil::CmsTemplate::getPriority () const` [inline, virtual]

Return the priority of a message when sending.

6.198.3.11 `virtual long long activemq::cmsutil::CmsTemplate::getReceiveTimeout () const`
[inline, virtual]

6.198.3.12 `virtual long long activemq::cmsutil::CmsTemplate::getTimeToLive () const`
[inline, virtual]

Return the time-to-live of the message when sending.

6.198.3.13 `void activemq::cmsutil::CmsTemplate::init () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)` [protected, virtual]

Initializes this object and prepares it for use.

This should be called before any other methods are called.

Reimplemented from `activemq::cmsutil::CmsDestinationAccessor` (p. 1189).

6.198.3.14 `virtual bool activemq::cmsutil::CmsTemplate::isExplicitQosEnabled () const`
`[inline, virtual]`

If "true", then the values of `deliveryMode`, `priority`, and `timeToLive` will be used when sending a message.

Otherwise, the default values, that may be set administratively, will be used.

Returns

true if overriding default values of QOS parameters (`deliveryMode`, `priority`, and `timeToLive`)

See also

`setDeliveryMode` (p. 1212)

`setPriority` (p. 1213)

`setTimeToLive` (p. 1214)

6.198.3.15 `virtual bool activemq::cmsutil::CmsTemplate::isMessageIdEnabled () const`
`[inline, virtual]`

6.198.3.16 `virtual bool activemq::cmsutil::CmsTemplate::isMessageTimestampEnabled ()`
`const [inline, virtual]`

6.198.3.17 `virtual bool activemq::cmsutil::CmsTemplate::isNoLocal () const` `[inline, virtual]`

6.198.3.18 `CmsTemplate& activemq::cmsutil::CmsTemplate::operator= (const`
`CmsTemplate &) [inline, protected]`

6.198.3.19 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive () throw (`
`cms::CMSEException) [virtual]`

Performs a synchronous read from the default destination.

Returns

the message

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs
---	---------------------------

6.198.3.20 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (const std::string & destinationName) throw (cms::CMSException) [virtual]`

Performs a synchronous read from the specified destination.

Parameters

<i>destination-Name</i>	the name of the destination to receive on (will be resolved to destination internally).
-------------------------	---

Returns

the message

Exceptions

<i>cms::CMSException</i> (p. 1190)	thrown if an error occurs
---------------------------------------	---------------------------

6.198.3.21 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (cms::Destination * destination) throw (cms::CMSException) [virtual]`

Performs a synchronous read from the specified destination.

Parameters

<i>destination</i>	the destination to receive on
--------------------	-------------------------------

Returns

the message

Exceptions

<i>cms::CMSException</i> (p. 1190)	thrown if an error occurs
---------------------------------------	---------------------------

6.198.3.22 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & destinationName, const std::string & selector) throw (cms::CMSException) [virtual]`

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

<i>destination-Name</i>	the name of the destination to receive on (will be resolved to destination internally).
<i>selector</i>	the selector expression.

Returns

the message

Exceptions

<i>cms::CMSException</i> (p. 1190)	thrown if an error occurs
--	---------------------------

6.198.3.23 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (cms::Destination * destination, const std::string & selector) throw (cms::CMSException)` [virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

<i>destination</i>	the destination to receive on.
<i>selector</i>	the selector expression.

Returns

the message

Exceptions

<i>cms::CMSException</i> (p. 1190)	thrown if an error occurs
--	---------------------------

6.198.3.24 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & selector) throw (cms::CMSException)` [virtual]

Performs a synchronous read consuming only messages identified by the given selector.

Parameters

<i>selector</i>	the selector expression.
-----------------	--------------------------

Returns

the message

Exceptions

<i>cms::CMSException</i> (p. 1190)	thrown if an error occurs
--	---------------------------

6.198.3.25 `virtual void activemq::cmsutil::CmsTemplate::send (const std::string & destinationName, MessageCreator * messageCreator) throw (cms::CMSEException) [virtual]`

Convenience method for sending a message to the specified destination.

Parameters

<i>destination-Name</i>	The name of the destination to send to.
<i>messageCreator</i>	Responsible for creating the message to be sent

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs.
---	----------------------------

6.198.3.26 `virtual void activemq::cmsutil::CmsTemplate::send (MessageCreator * messageCreator) throw (cms::CMSEException) [virtual]`

Convenience method for sending a message to the default destination.

Parameters

<i>messageCreator</i>	Responsible for creating the message to be sent
-----------------------	---

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs.
---	----------------------------

6.198.3.27 `virtual void activemq::cmsutil::CmsTemplate::send (cms::Destination * dest, MessageCreator * messageCreator) throw (cms::CMSEException) [virtual]`

Convenience method for sending a message to the specified destination.

Parameters

<i>dest</i>	The destination to send to
<i>messageCreator</i>	Responsible for creating the message to be sent

Exceptions

<i>cms::CMSEException</i> (p. 1190)	thrown if an error occurs.
---	----------------------------

6.198.3.28 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestination (cms::Destination * defaultDestination) [inline, virtual]`

Sets the destination object to be used by default for send/receive operations.

If no default destination is provided, the `defaultDestinationName` property is used to resolve this default destination for send/receive operations.

Parameters

<i>defaultDestination</i>	the default destination
---------------------------	-------------------------

6.198.3.29 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestinationName (const std::string & defaultDestinationName) [inline, virtual]`

Sets the name of the default destination to be used from send/receive operations.

Calling this method will set the `defaultDestination` property to NULL. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Parameters

<i>defaultDestinationName</i>	the name of the destination for send/receive to by default.
-------------------------------	---

6.198.3.30 `virtual void activemq::cmsutil::CmsTemplate::setDeliveryMode (int deliveryMode) [inline, virtual]`

Set the delivery mode to use when sending a message.

Default is the Message default: "PERSISTENT".

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters

<i>deliveryMode</i>	the delivery mode to use
---------------------	--------------------------

See also

isExplicitQosEnabled (p. 1208)

6.198.3.31 `virtual void activemq::cmsutil::CmsTemplate::setDeliveryPersistent (bool deliveryPersistent) [inline, virtual]`

Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").

This will set the delivery mode accordingly, to either "PERSISTENT" or "NON_PERSISTENT".

Default it "true" aka delivery mode "PERSISTENT".

See also

`setDeliveryMode(int)` (p. 1212)

6.198.3.32 `virtual void activemq::cmsutil::CmsTemplate::setExplicitQosEnabled (bool explicitQosEnabled) [inline, virtual]`

Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

See also

`setDeliveryMode` (p. 1212)

`setPriority` (p. 1213)

`setTimeToLive` (p. 1214)

6.198.3.33 `virtual void activemq::cmsutil::CmsTemplate::setMessageIdEnabled (bool messageIdEnabled) [inline, virtual]`

6.198.3.34 `virtual void activemq::cmsutil::CmsTemplate::setMessageTimestampEnabled (bool messageTimestampEnabled) [inline, virtual]`

6.198.3.35 `virtual void activemq::cmsutil::CmsTemplate::setNoLocal (bool noLocal) [inline, virtual]`

6.198.3.36 `virtual void activemq::cmsutil::CmsTemplate::setPriority (int priority) [inline, virtual]`

Set the priority of a message when sending.

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

See also

`isExplicitQosEnabled` (p. 1208)

6.198.3.37 `virtual void activemq::cmsutil::CmsTemplate::setPubSubDomain (bool pubSubDomain) [inline, virtual]`

Indicates whether the default destination is a topic (true) or a queue (false).

Calling this method will set the `defaultDestination` property to NULL.

Parameters

<i>pubSubDomain</i>	indicates whether to use pub-sub messaging (topics).
---------------------	--

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 1190).

References `activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain()`.

6.198.3.38 `virtual void activemq::cmsutil::CmsTemplate::setReceiveTimeout (long long receiveTimeout) [inline, virtual]`

6.198.3.39 `virtual void activemq::cmsutil::CmsTemplate::setTimeToLive (long long timeToLive) [inline, virtual]`

Set the time-to-live of the message when sending.

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters

<i>timeToLive</i>	the message's lifetime (in milliseconds)
-------------------	--

Public Member Functions

- virtual **~Collection** ()
- virtual bool **add** (const E &value)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)
Returns true if this collection changed as a result of the call.
- virtual bool **addAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)
Adds all of the elements in the specified collection to this collection.
- virtual void **clear** ()=0 throw (lang::exceptions::UnsupportedOperationException)
Removes all of the elements from this collection (optional operation).
- virtual bool **contains** (const E &value) const =0 throw (lang::Exception)
Returns true if this collection contains the specified element.

- virtual bool **containsAll** (const **Collection**< E > &collection) const =0 throw (lang::Exception)
Returns true if this collection contains all of the elements in the specified collection.
- virtual bool **equals** (const **Collection**< E > &value) const =0
Compares the passed collection to this one, if they contain the same elements, i.e.
- virtual bool **isEmpty** () const =0
- virtual bool **remove** (const E &value)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes a single instance of the specified element from the collection.
- virtual bool **removeAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes all this collection's elements that are also contained in the specified collection (optional operation).
- virtual bool **retainAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Retains only the elements in this collection that are contained in the specified collection (optional operation).
- virtual std::size_t **size** () const =0
Returns the number of elements in this collection.
- virtual std::vector< E > **toArray** () const =0
Returns an array containing all of the elements in this collection.

6.200.1 Detailed Description

template<typename E> class decaf::util::Collection< E >

The root interface in the collection hierarchy. A collection represents a group of objects, known as its elements. Some collections allow duplicate elements and others do not. Some are ordered and others unordered. This interface is typically used to pass collections around and manipulate them where maximum generality is desired.

All general-purpose **Collection** (p. 1216) implementation classes (which typically implement **Collection** (p. 1216) indirectly through one of its subinterfaces) should provide two "standard" constructors: a void (no arguments) constructor, which creates an empty collection, and a constructor with a single argument of type **Collection** (p. 1216), which creates a new collection with the same elements as its argument. In effect, the latter constructor allows the user to copy any collection, producing an equivalent collection of the desired implementation type. There is no way to enforce this convention (as interfaces cannot contain constructors) but all of the general-purpose **Collection** (p. 1216) implementations in the Decaf platform libraries comply.

The "destructive" methods contained in this interface, that is, the methods that modify the collection on which they operate, are specified to throw `UnsupportedOperationException` if this collection does not support the operation. If this is the case, these methods may, but are not required to, throw an `UnsupportedOperationException` if the invocation would have no effect on the collection. For example, invoking the `addAll(Collection)` method on an unmodifiable collection may, but is not required to, throw the exception if the collection to be added is empty.

Many methods in Collections Framework interfaces are defined in terms of the `equals` method. For example, the specification for the `contains(Object o)` method says: "returns true if and only if this collection contains at least one element `e` such that `(o==null ? e==null : o.equals(e))`."

Since

1.0

6.200.2 Constructor & Destructor Documentation

6.200.2.1 `template<typename E> virtual decaf::util::Collection< E >::~~Collection ()`
[inline, virtual]

6.200.3 Member Function Documentation

6.200.3.1 `template<typename E> virtual bool decaf::util::Collection< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)` [pure virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1216) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

<i>value</i>	- reference to the element to add.
--------------	------------------------------------

Returns

true if the element was added

Exceptions

<i>UnsupportedOperationException</i>	
<i>IllegalArgumentException</i>	
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions

Implemented in **decaf::util::AbstractQueue< E >** (p. 177), **decaf::util::PriorityQueue< E >** (p. 3120), **decaf::util::StlList< E >** (p. 3700), **decaf::util::StlSet< E >** (p. 3734), **decaf::util::StlList< cms::MessageConsumer * >** (p. 3700), **decaf::util::StlList< CompositeTask * >** (p. 3700), **decaf::util::StlList< URI >** (p. 3700), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3700), **decaf::util::StlList< PrimitiveValueNode >** (p. 3700), **decaf::util::StlList< Pointer< Command > >** (p. 3700), **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3700), **decaf::util::StlList< cms::MessageProducer * >** (p. 3700), **decaf::util::StlList< cms::Destination * >** (p. 3700), **decaf::util::StlList< cms::Session * >** (p. 3700), **decaf::util::StlList< cms::Connection * >** (p. 3700), **decaf::util::StlSet< transport::TransportListener * >** (p. 3734), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 3734), **decaf::util::StlSet< Resource * >** (p. 3734), and **decaf::util::StlSet< ActiveMQSession * >** (p. 3734).

```
6.200.3.2  template<typename E> virtual bool decaf::util::Collection<
           E >::addAll ( const Collection< E > & collection ) throw (
               lang::exceptions::UnsupportedOperationException,
               lang::exceptions::IllegalArgumentException,
               lang::exceptions::IllegalStateException ) [pure virtual]
```

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

<i>collection</i>	- Collection (p. 1216) whose elements are added to this one.
-------------------	---

Returns

true if this collection changed as a result of the call

Exceptions

<i>UnsupportedOperationException</i>	
<i>IllegalArgumentException</i>	

<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions
------------------------------	---

Implemented in `decaf::util::AbstractCollection< E >` (p. 163), `decaf::util::AbstractQueue< E >` (p. 177), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 163), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 163), `decaf::util::AbstractCollection< Resource * >` (p. 163), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 163), `decaf::util::AbstractCollection< CompositeTask * >` (p. 163), `decaf::util::AbstractCollection< URI >` (p. 163), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 163), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 163), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 163), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 163), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 163), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 163), `decaf::util::AbstractCollection< cms::Destination * >` (p. 163), `decaf::util::AbstractCollection< cms::Session * >` (p. 163), and `decaf::util::AbstractCollection< cms::Connection * >` (p. 163).

```
6.200.3.3  template<typename E> virtual void decaf::util::Collection< E >::clear ( )
            throw ( lang::exceptions::UnsupportedOperationException ) [pure
            virtual]
```

Removes all of the elements from this collection (optional operation).

This collection will be empty after this method returns unless it throws an exception.

Exceptions

<i>UnsupportedOperationException</i>	
--------------------------------------	--

Implemented in `decaf::util::AbstractCollection< E >` (p. 163), `decaf::util::AbstractQueue< E >` (p. 178), `decaf::util::concurrent::SynchronousQueue< E >` (p. 3830), `decaf::util::PriorityQueue< E >` (p. 3120), `decaf::util::StlList< E >` (p. 3702), `decaf::util::StlSet< E >` (p. 3735), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 163), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 163), `decaf::util::AbstractCollection< Resource * >` (p. 163), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 163), `decaf::util::AbstractCollection< CompositeTask * >` (p. 163), `decaf::util::AbstractCollection< URI >` (p. 163), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 163), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 163), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 163), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 163), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 163), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 163), `decaf::util::AbstractCollection< cms::Destination * >` (p. 163), `decaf::util::AbstractCollection< cms::Session * >` (p. 163), `decaf::util::AbstractCollection< cms::Connection * >` (p. 163), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3702), `decaf::util::StlList< CompositeTask * >` (p. 3702), `decaf::util::StlList< URI >` (p. 3702), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3702), `decaf::util::StlList< PrimitiveValueNode >` (p. 3702), `decaf::util::StlList< Pointer< Command > >` (p. 3702), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3702), `decaf::util::StlList< cms::MessageProducer`

* > (p. 3702), **decaf::util::StlList**< **cms::Destination** * > (p. 3702), **decaf::util::StlList**< **cms::Session** * > (p. 3702), **decaf::util::StlList**< **cms::Connection** * > (p. 3702), **decaf::util::StlSet**< **transport::TransportListener** * > (p. 3735), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 3735), **decaf::util::StlSet**< **Resource** * > (p. 3735), and **decaf::util::StlSet**< **ActiveMQSession** * > (p. 3735).

6.200.3.4 `template<typename E> virtual bool decaf::util::Collection< E >::contains (const E & value) const throw (lang::Exception) [pure virtual]`

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element *e* such that (*o*==null ? *e*==null : *o.equals(e)*).

Parameters

<i>value</i>	- value to check for presence in the collection
--------------	---

Returns

true if there is at least one of the elements in the collection

Exceptions

<i>Exception</i>	
------------------	--

Implemented in **decaf::util::AbstractCollection**< **E** > (p. 164), **decaf::util::StlList**< **E** > (p. 3702), **decaf::util::StlSet**< **E** > (p. 3736), **decaf::util::AbstractCollection**< **transport::TransportListener** * > (p. 164), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 164), **decaf::util::AbstractCollection**< **Resource** * > (p. 164), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 164), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 164), **decaf::util::AbstractCollection**< **URI** > (p. 164), **decaf::util::AbstractCollection**< **ActiveMQSession** * > (p. 164), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 164), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 164), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 164), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 164), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 164), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 164), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 164), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 164), **decaf::util::StlList**< **cms::MessageConsumer** * > (p. 3702), **decaf::util::StlList**< **CompositeTask** * > (p. 3702), **decaf::util::StlList**< **URI** > (p. 3702), **decaf::util::StlList**< **Pointer**< **DestinationInfo** > > (p. 3702), **decaf::util::StlList**< **PrimitiveValueNode** > (p. 3702), **decaf::util::StlList**< **Pointer**< **Command** > > (p. 3702), **decaf::util::StlList**< **Pointer**< **BackupTransport** > > (p. 3702), **decaf::util::StlList**< **cms::MessageProducer** * > (p. 3702), **decaf::util::StlList**< **cms::Destination** * > (p. 3702), **decaf::util::StlList**< **cms::Session** * > (p. 3702), **decaf::util::StlList**< **cms::Connection** * > (p. 3702), **decaf::util::StlSet**< **transport::TransportListener** * > (p. 3736), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 3736), **decaf::util::StlSet**< **Resource** * > (p. 3736), and **decaf::util::StlSet**< **ActiveMQSession** * > (p. 3736).

```
6.200.3.5  template<typename E> virtual bool decaf::util::Collection< E >::containsAll (
            const Collection< E > & collection ) const throw ( lang::Exception )  [pure
            virtual]
```

Returns true if this collection contains all of the elements in the specified collection.

Parameters

<i>collection</i>	- Collection (p. 1216) to compare to this one.
-------------------	---

Exceptions

<i>Exception</i>

Implemented in **decaf::util::AbstractCollection< E >** (p. 165), **decaf::util::concurrent::SynchronousQueue< E >** (p. 3830), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 165), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 165), **decaf::util::AbstractCollection< Resource * >** (p. 165), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 165), **decaf::util::AbstractCollection< CompositeTask * >** (p. 165), **decaf::util::AbstractCollection< URI >** (p. 165), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 165), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 165), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 165), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 165), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 165), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 165), **decaf::util::AbstractCollection< cms::Destination * >** (p. 165), **decaf::util::AbstractCollection< cms::Session * >** (p. 165), and **decaf::util::AbstractCollection< cms::Connection * >** (p. 165).

```
6.200.3.6  template<typename E> virtual bool decaf::util::Collection< E >::equals (
            const Collection< E > & value ) const  [pure virtual]
```

Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.

Returns

true if the Collections contain the same elements.

Implemented in **decaf::util::AbstractCollection< E >** (p. 166), **decaf::util::concurrent::SynchronousQueue< E >** (p. 3832), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 166), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 166), **decaf::util::AbstractCollection< Resource * >** (p. 166), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 166), **decaf::util::AbstractCollection< CompositeTask * >** (p. 166), **decaf::util::AbstractCollection< URI >** (p. 166), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 166), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 166), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 166), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 166), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 166), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 166), **decaf::util::AbstractCollection< cms::Destination**

* > (p. 166), **decaf::util::AbstractCollection< cms::Session * >** (p. 166), and **decaf::util::AbstractCollection< cms::Connection * >** (p. 166).

6.200.3.7 `template<typename E> virtual bool decaf::util::Collection< E >::isEmpty ()`
`const [pure virtual]`

Returns

true if this collection contains no elements.

Implemented in **decaf::util::AbstractCollection< E >** (p. 166), **decaf::util::concurrent::SynchronousQueue< E >** (p. 3833), **decaf::util::StlList< E >** (p. 3704), **decaf::util::StlSet< E >** (p. 3736), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 166), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 166), **decaf::util::AbstractCollection< Resource * >** (p. 166), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 166), **decaf::util::AbstractCollection< CompositeTask * >** (p. 166), **decaf::util::AbstractCollection< URI >** (p. 166), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 166), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 166), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 166), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 166), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 166), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 166), **decaf::util::AbstractCollection< cms::Destination * >** (p. 166), **decaf::util::AbstractCollection< cms::Session * >** (p. 166), **decaf::util::AbstractCollection< cms::Connection * >** (p. 166), **decaf::util::StlList< cms::MessageConsumer * >** (p. 3704), **decaf::util::StlList< CompositeTask * >** (p. 3704), **decaf::util::StlList< URI >** (p. 3704), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3704), **decaf::util::StlList< PrimitiveValueNode >** (p. 3704), **decaf::util::StlList< Pointer< Command > >** (p. 3704), **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3704), **decaf::util::StlList< cms::MessageProducer * >** (p. 3704), **decaf::util::StlList< cms::Destination * >** (p. 3704), **decaf::util::StlList< cms::Session * >** (p. 3704), **decaf::util::StlList< cms::Connection * >** (p. 3704), **decaf::util::StlSet< transport::TransportListener * >** (p. 3736), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 3736), **decaf::util::StlSet< Resource * >** (p. 3736), and **decaf::util::StlSet< ActiveMQSession * >** (p. 3736).

6.200.3.8 `template<typename E> virtual bool decaf::util::Collection< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [pure virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element *e* such that (*o*==null ? *e*==null : *o*.equals(*e*)), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

<i>value</i>	- reference to the element to remove.
--------------	---------------------------------------

Returns

true if the collection was changed

Exceptions

<i>UnsupportedOperationException</i>	
<i>IllegalArgumentException</i>	

Implemented in `decaf::util::AbstractCollection< E >` (p. 168), `decaf::util::PriorityQueue< E >` (p. 3123), `decaf::util::StlList< E >` (p. 3706), `decaf::util::StlSet< E >` (p. 3737), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 168), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 168), `decaf::util::AbstractCollection< Resource * >` (p. 168), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 168), `decaf::util::AbstractCollection< CompositeTask * >` (p. 168), `decaf::util::AbstractCollection< URI >` (p. 168), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 168), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 168), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 168), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 168), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 168), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 168), `decaf::util::AbstractCollection< cms::Destination * >` (p. 168), `decaf::util::AbstractCollection< cms::Session * >` (p. 168), `decaf::util::AbstractCollection< cms::Connection * >` (p. 168), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3706), `decaf::util::StlList< CompositeTask * >` (p. 3706), `decaf::util::StlList< URI >` (p. 3706), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3706), `decaf::util::StlList< PrimitiveValueNode >` (p. 3706), `decaf::util::StlList< Pointer< Command > >` (p. 3706), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3706), `decaf::util::StlList< cms::MessageProducer * >` (p. 3706), `decaf::util::StlList< cms::Destination * >` (p. 3706), `decaf::util::StlList< cms::Session * >` (p. 3706), `decaf::util::StlList< cms::Connection * >` (p. 3706), `decaf::util::StlSet< transport::TransportListener * >` (p. 3737), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 3737), `decaf::util::StlSet< Resource * >` (p. 3737), and `decaf::util::StlSet< ActiveMQSession * >` (p. 3737).

```
6.200.3.9  template<typename E> virtual bool decaf::util::Collection<
            E >::removeAll( const Collection< E > & collection ) throw
            ( lang::exceptions::UnsupportedOperationException,
              lang::exceptions::IllegalArgumentException ) [pure virtual]
```

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

<i>collection</i>	- The Collection (p. 1216) whose elements are to be removed
-------------------	--

Returns

true if the collection changed as a result of this call

Exceptions

<i>UnsupportedOperationException</i>	
<i>IllegalArgumentException</i>	

Implemented in **decaf::util::AbstractCollection< E >** (p. 169), **decaf::util::AbstractSet< E >** (p. 181), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 169), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 169), **decaf::util::AbstractCollection< Resource * >** (p. 169), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 169), **decaf::util::AbstractCollection< CompositeTask * >** (p. 169), **decaf::util::AbstractCollection< URI >** (p. 169), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 169), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 169), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 169), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 169), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 169), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 169), **decaf::util::AbstractCollection< cms::Destination * >** (p. 169), **decaf::util::AbstractCollection< cms::Session * >** (p. 169), **decaf::util::AbstractCollection< cms::Connection * >** (p. 169), **decaf::util::AbstractSet< transport::TransportListener * >** (p. 181), **decaf::util::AbstractSet< Pointer< Synchronization > >** (p. 181), **decaf::util::AbstractSet< Resource * >** (p. 181), and **decaf::util::AbstractSet< ActiveMQSession * >** (p. 181).

```
6.200.3.10  template<typename E> virtual bool decaf::util::Collection<
              E >::retainAll ( const Collection< E > & collection ) throw
              ( lang::exceptions::UnsupportedOperationException,
                lang::exceptions::IllegalArgumentException ) [pure virtual]
```

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

<i>collection</i>	- The Collection (p. 1216) whose elements are to be retained
-------------------	---

Returns

true if the collection changed as a result of this call

Exceptions

<i>UnsupportedOperationException</i>	
--------------------------------------	--

<i>IllegalArgumentEx- ception</i>

Implemented in `decaf::util::AbstractCollection< E >` (p. 170), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 170), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 170), `decaf::util::AbstractCollection< Resource * >` (p. 170), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 170), `decaf::util::AbstractCollection< CompositeTask * >` (p. 170), `decaf::util::AbstractCollection< URI >` (p. 170), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 170), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 170), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 170), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 170), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 170), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 170), `decaf::util::AbstractCollection< cms::Destination * >` (p. 170), `decaf::util::AbstractCollection< cms::Session * >` (p. 170), and `decaf::util::AbstractCollection< cms::Connection * >` (p. 170).

6.200.3.11 `template<typename E> virtual std::size_t decaf::util::Collection< E >::size () const [pure virtual]`

Returns the number of elements in this collection.

If this collection contains more than `Integer.MAX_VALUE` elements, returns `Integer.MAX_VALUE`.

Returns

the number of elements in this collection

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3837), `decaf::util::PriorityQueue< E >` (p. 3124), `decaf::util::StlList< E >` (p. 3708), `decaf::util::StlSet< E >` (p. 3737), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3708), `decaf::util::StlList< CompositeTask * >` (p. 3708), `decaf::util::StlList< URI >` (p. 3708), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3708), `decaf::util::StlList< PrimitiveValueNode >` (p. 3708), `decaf::util::StlList< Pointer< Command > >` (p. 3708), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3708), `decaf::util::StlList< cms::MessageProducer * >` (p. 3708), `decaf::util::StlList< cms::Destination * >` (p. 3708), `decaf::util::StlList< cms::Session * >` (p. 3708), `decaf::util::StlList< cms::Connection * >` (p. 3708), `decaf::util::StlSet< transport::TransportListener * >` (p. 3737), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 3737), `decaf::util::StlSet< Resource * >` (p. 3737), and `decaf::util::StlSet< ActiveMQSession * >` (p. 3737).

Referenced by `decaf::util::AbstractCollection< cms::Connection * >::equals()`, `decaf::util::AbstractCollection< cms::Connection * >::isEmpty()`, `decaf::util::AbstractSet< ActiveMQSession * >::removeAll()`, and `decaf::util::AbstractCollection< cms::Connection * >::toArray()`.

6.200.3.12 `template<typename E> virtual std::vector<E> decaf::util::Collection< E >::toArray () const [pure virtual]`

Returns an array containing all of the elements in this collection.

If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns

an array of the elements in this collection.

Implemented in `decaf::util::AbstractCollection< E >` (p. 170), `decaf::util::concurrent::SynchronousQueue< E >` (p. 3838), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 170), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 170), `decaf::util::AbstractCollection< Resource * >` (p. 170), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 170), `decaf::util::AbstractCollection< CompositeTask * >` (p. 170), `decaf::util::AbstractCollection< URI >` (p. 170), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 170), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 170), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 170), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 170), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 170), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 170), `decaf::util::AbstractCollection< cms::Destination * >` (p. 170), `decaf::util::AbstractCollection< cms::Session * >` (p. 170), and `decaf::util::AbstractCollection< cms::Connection * >` (p. 170).

6.201.1 Constructor & Destructor Documentation

- 6.201.1.1 virtual activemq::commands::Command::~~Command () [inline, virtual]

6.201.2 Member Function Documentation

- 6.201.2.1 virtual int activemq::commands::Command::getCommandId () const [pure virtual]

Gets the **Command** (p. 1227) Id of this **Message** (p. 2596).

Returns

Command (p. 1227) Id

Implemented in **activemq::commands::BaseCommand** (p. 767).

6.201.2.2 `virtual bool activemq::commands::Command::isBrokerInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 767), and **activemq::commands::BrokerInfo** (p. 907).

6.201.2.3 `virtual bool activemq::commands::Command::isConnectionInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 768), and **activemq::commands::ConnectionInfo** (p. 1397).

6.201.2.4 `virtual bool activemq::commands::Command::isConsumerInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 768), and **activemq::commands::ConsumerInfo** (p. 1506).

6.201.2.5 `virtual bool activemq::commands::Command::isKeepAliveInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 768), and **activemq::commands::KeepAliveInfo** (p. 2337).

6.201.2.6 `virtual bool activemq::commands::Command::isMessage () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 768), and **activemq::commands::Message** (p. 2608).

6.201.2.7 `virtual bool activemq::commands::Command::isMessageAck () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 768), and **activemq::commands::MessageAck** (p. 2646).

6.201.2.8 `virtual bool activemq::commands::Command::isMessageDispatch () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 768), and **activemq::commands::MessageDispatch** (p. 2681).

6.201.2.9 `virtual bool activemq::commands::Command::isMessageDispatchNotification () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 768), and **activemq::commands::MessageDispatch** (p. 2719).

6.201.2.10 `virtual bool activemq::commands::Command::isProducerAck () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 769), and **activemq::commands::ProducerAck** (p. 3127).

6.201.2.11 `virtual bool activemq::commands::Command::isProducerInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 769), and **activemq::commands::ProducerInfo** (p. 3188).

6.201.2.12 `virtual bool activemq::commands::Command::isRemoveInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 769), and **activemq::commands::RemoveInfo** (p. 3286).

6.201.2.13 `virtual bool activemq::commands::Command::isRemoveSubscriptionInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 769), and **activemq::commands::RemoveSubscriptionInfo** (p. 3316).

6.201.2.14 `virtual bool activemq::commands::Command::isResponse () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 769), and **activemq::commands::Response** (p. 3381).

6.201.2.15 `virtual bool activemq::commands::Command::isResponseRequired () const [pure virtual]`

Is a **Response** (p. 3379) required for this **Command** (p. 1227).

Returns

true if a response is required.

Implemented in **activemq::commands::BaseCommand** (p. 769).

6.201.2.16 `virtual bool activemq::commands::Command::isShutdownInfo () const` [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 770), and **activemq::commands::ShutdownInfo** (p. 3575).

6.201.2.17 `virtual bool activemq::commands::Command::isTransactionInfo () const` [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 770), and **activemq::commands::TransactionInfo** (p. 3962).

6.201.2.18 `virtual bool activemq::commands::Command::isWireFormatInfo () const` [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 770), and **activemq::commands::WireFormatInfo** (p. 4101).

6.201.2.19 `virtual void activemq::commands::Command::setCommandId (int id)` [pure virtual]

Sets the **Command** (p. 1227) Id of this **Message** (p. 2596).

Parameters

<i>id</i>	Command (p. 1227) Id
-----------	-----------------------------

Implemented in **activemq::commands::BaseCommand** (p. 770).

6.201.2.20 `virtual void activemq::commands::Command::setResponseRequired (const bool required)` [pure virtual]

Set if this **Message** (p. 2596) requires a **Response** (p. 3379).

Parameters

<i>required</i>	true if response is required
-----------------	------------------------------

Implemented in **activemq::commands::BaseCommand** (p. 770).

6.201.2.21 `virtual std::string activemq::commands::Command::toString () const` [pure virtual]

Returns a provider-specific string that provides information about the contents of the command.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 189), `activemq::commands::ActiveMQMapMessage` (p. 229), `activemq::commands::ActiveMQMapMessage` (p. 364), `activemq::commands::ActiveMQMessage` (p. 392), `activemq::commands::ActiveMQObjectMessage` (p. 440), `activemq::commands::ActiveMQStreamMessage` (p. 547), `activemq::commands::ActiveMQTextMessage` (p. 671), `activemq::commands::BaseCommand` (p. 770), `activemq::commands::BrokerInfo` (p. 908), `activemq::commands::ConnectionControl` (p. 1305), `activemq::commands::ConnectionError` (p. 1335), `activemq::commands::ConnectionInfo` (p. 1398), `activemq::commands::ConsumerControl` (p. 1445), `activemq::commands::ConsumerInfo` (p. 1507), `activemq::commands::ControlCommand` (p. 1538), `activemq::commands::DataArrayResponse` (p. 1574), `activemq::commands::DataResponse` (p. 1634), `activemq::commands::DestinationInfo` (p. 1783), `activemq::commands::ExceptionResponse` (p. 1897), `activemq::commands::FlushCommand` (p. 2001), `activemq::commands::IntegerResponse` (p. 2162), `activemq::commands::KeepAliveInfo` (p. 2337), `activemq::commands::Message` (p. 2611), `activemq::commands::MessageAck` (p. 2647), `activemq::commands::MessageDispatch` (p. 2682), `activemq::commands::MessageDispatchNotification` (p. 2719), `activemq::commands::MessagePull` (p. 2827), `activemq::commands::ProducerAck` (p. 3127), `activemq::commands::ProducerInfo` (p. 3189), `activemq::commands::RemoveInfo` (p. 3287), `activemq::commands::RemoveSubscriptionInfo` (p. 3317), `activemq::commands::ReplayCommand` (p. 3346), `activemq::commands::Response` (p. 3382), `activemq::commands::SessionInfo` (p. 3507), `activemq::commands::ShutdownInfo` (p. 3575), `activemq::commands::TransactionInfo` (p. 3963), and `activemq::commands::WireFormatInfo` (p. 4104).

```
6.201.2.22 virtual decaf::lang::Pointer<commands::Command>
activemq::commands::Command::visit ( activemq::state::CommandVisitor *
visitor ) throw ( exceptions::ActiveMQException ) [pure virtual]
```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implemented in `activemq::commands::BrokerError` (p. 873), `activemq::commands::BrokerInfo` (p. 909), `activemq::commands::ConnectionControl` (p. 1306), `activemq::commands::ConnectionError` (p. 1335), `activemq::commands::ConnectionInfo` (p. 1399), `activemq::commands::ConsumerControl` (p. 1446), `activemq::commands::ConsumerInfo` (p. 1508), `activemq::commands::ControlCommand` (p. 1539), `activemq::commands::DestinationInfo` (p. 1783), `activemq::commands::FlushCommand` (p. 2001), `activemq::commands::KeepAliveInfo` (p. 2338), `activemq::commands::Message` (p. 2612), `activemq::commands::MessageAck` (p. 2647), `activemq::commands::MessageDispatch` (p. 2682), `activemq::commands::MessageDispatchNotification` (p. 2720), `activemq::commands::MessagePull` (p. 2828), `activemq::commands::ProducerAck` (p. 3128), `activemq::commands::ProducerInfo` (p. 3189), `activemq::commands::RemoveInfo` (p. 3287), `activemq::commands::RemoveSubscriptionInfo` (p. 3317), `activemq::commands::ReplayCommand` (p. 3346), `activemq::commands::Response` (p. 3382), `activemq::commands::SessionInfo` (p. 3508), `activemq::commands::ShutdownInfo` (p. 3575), `activemq::commands::TransactionInfo` (p. 3963), and `activemq::commands::WireFormatInfo` (p. 4104).

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/Command.h`

6.202 activemq::state::CommandVisitor Class Reference

Interface for an Object that can visit the various Command Objects that are sent from and to this client.

```
#include <src/main/activemq/state/CommandVisitor.h>
```

Inheritance diagram for activemq::state::CommandVisitor:

6.202.1 Detailed Description

Interface for an Object that can visit the various Command Objects that are sent from and to this client. The Commands themselves implement a `visit` method that is called with an instance of this interface and each one then call the appropriate `processXXX` method.

Since

6.204 decaf::lang::Comparable< T > Class Template Reference

This interface imposes a total ordering on the objects of each class that implements it.

```
#include <src/main/decaf/lang/Comparable.h>
```

Public Member Functions

- virtual `~Comparable()`
- virtual `int compareTo (const T &value) const =0`
Compares this object with the specified object for order.
- virtual `bool equals (const T &value) const =0`
- virtual `bool operator== (const T &value) const =0`
Compares equality between this object and the one passed.
- virtual `bool operator< (const T &value) const =0`
Compares this object to another and returns true if this object is considered to be less than the one passed.

6.204.1 Detailed Description

```
template<typename T> class decaf::lang::Comparable< T >
```

This interface imposes a total ordering on the objects of each class that implements it. This ordering is referred to as the class's natural ordering, and the class's `compareTo` method is referred to as its natural comparison method.

6.204.2 Constructor & Destructor Documentation

6.204.2.1 `template<typename T> virtual decaf::lang::Comparable< T >::~~Comparable() [inline, virtual]`

6.204.3 Member Function Documentation

6.204.3.1 `template<typename T> virtual int decaf::lang::Comparable< T >::compareTo (const T & value) const [pure virtual]`

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all `x` and `y`. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementer must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all `z`.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the **Comparable** (p. 1248) interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters

<i>value</i>	- the Object to be compared.
--------------	------------------------------

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Implemented in **decaf::lang::Boolean** (p. 857), **decaf::lang::Boolean** (p. 858), **decaf::lang::Byte** (p. 972), **decaf::lang::Byte** (p. 972), **decaf::lang::Character** (p. 1129), **decaf::lang::Character** (p. 1129), **decaf::lang::Double** (p. 1845), **decaf::lang::Double** (p. 1845), **decaf::lang::Float** (p. 1965), **decaf::lang::Float** (p. 1965), **decaf::lang::Integer** (p. 2148), **decaf::lang::Integer** (p. 2147), **decaf::lang::Long** (p. 2499), **decaf::lang::Long** (p. 2499), **decaf::lang::Short** (p. 3542), and **decaf::lang::Short** (p. 3541).

6.204.3.2 `template<typename T> virtual bool decaf::lang::Comparable< T >::equals (const T & value) const` [pure virtual]

Returns

true if this value is considered equal to the passed value.

Implemented in **decaf::lang::Boolean** (p. 858), **decaf::lang::Boolean** (p. 858), **decaf::lang::Byte** (p. 974), **decaf::lang::Byte** (p. 974), **decaf::lang::Character** (p. 1130), **decaf::lang::Character** (p. 1130), **decaf::lang::Double** (p. 1847), **decaf::lang::Double** (p. 1847), **decaf::lang::Float** (p. 1966), **decaf::lang::Float** (p. 1966), **decaf::lang::Integer** (p. 2149), **decaf::lang::Integer** (p. 2149), **decaf::lang::Long** (p. 2500), **decaf::lang::Long** (p. 2501), **decaf::lang::Short** (p. 3543), and **decaf::lang::Short** (p. 3543).

6.204.3.3 `template<typename T> virtual bool decaf::lang::Comparable< T >::operator< (const T & value) const` [pure virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implemented in **decaf::lang::Boolean** (p. 859), **decaf::lang::Boolean** (p. 858), **decaf::lang::Byte** (p. 975), **decaf::lang::Byte** (p. 975), **decaf::lang::Character** (p. 1132), **decaf::lang::Character** (p. 1133), **decaf::lang::Double** (p. 1849), **decaf::lang::Double** (p. 1849), **decaf::lang::Float** (p. 1969), **decaf::lang::Float** (p. 1969), **decaf::lang::Integer** (p. 2152), **decaf::lang::Integer** (p. 2151), **decaf::lang::Long** (p. 2503), **decaf::lang::Long** (p. 2503), **decaf::lang::Short** (p. 3544), and **decaf::lang::Short** (p. 3544).

6.204.3.4 `template<typename T> virtual bool decaf::lang::Comparable< T >::operator== (const T & value) const` [pure virtual]

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implemented in `decaf::lang::Boolean` (p. 859), `decaf::lang::Boolean` (p. 859), `decaf::lang::Byte` (p. 975), `decaf::lang::Byte` (p. 976), `decaf::lang::Character` (p. 1133), `decaf::lang::Character` (p. 1133), `decaf::lang::Double` (p. 1849), `decaf::lang::Double` (p. 1850), `decaf::lang::Float` (p. 1970), `decaf::lang::Float` (p. 1970), `decaf::lang::Integer` (p. 2152), `decaf::lang::Integer` (p. 2152), `decaf::lang::Long` (p. 2504), `decaf::lang::Long` (p. 2504), `decaf::lang::Short` (p. 3544), and `decaf::lang::Short` (p. 3545).

6.205 `decaf::util::Comparator< T >` Class Template Reference

A comparison function, which imposes a total ordering on some collection of objects.

```
#include <src/main/decaf/util/Comparator.h>
```

Inheritance diagram for `decaf::util::Comparator< T >`:

Public Member Functions

- virtual `~Comparator()`
- virtual bool **operator**() (const T &left, const T &right) const =0

*Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1251) to be passed to an STL **Map** (p. 2538) for use as the sorting criteria.*

- virtual int **compare** (const T &o1, const T &o2) const =0

Compares its two arguments for order.

6.205.1 Detailed Description

```
template<typename T> class decaf::util::Comparator< T >
```

A comparison function, which imposes a total ordering on some collection of objects. Comparators can be passed to a sort method (such as `Collections.sort`) to allow precise control over the sort order. Comparators can also be used to control the order of certain data structures.

The ordering imposed by a **Comparator** (p. 1251) `c` on a set of elements `S` is said to be consistent with equals if and only if `(compare(e1, e2) == 0)` has the same boolean value as `(e1 == e2)` for every `e1` and `e2` in `S`.

6.205.2 Constructor & Destructor Documentation

6.205.2.1 `template<typename T> virtual decaf::util::Comparator< T >::~Comparator() [inline, virtual]`

6.205.3 Member Function Documentation

6.205.3.1 `template<typename T> virtual int decaf::util::Comparator< T >::compare (const T & o1, const T & o2) const [pure virtual]`

Compares its two arguments for order.

Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that `sgn(compare(x, y)) == -sgn(compare(y, x))` for all `x` and `y`. (This implies that `compare(x, y)` must throw an exception if and only if `compare(y, x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `((compare(x, y)>0) && (compare(y, z)>0))` implies `compare(x, z)>0`.

Finally, the implementer must ensure that `compare(x, y)==0` implies that `sgn(compare(x, z))==sgn(compare(y, z))` for all `z`.

It is generally the case, but not strictly required that `(compare(x, y)==0) == (x == y)`. Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters

<i>o1</i>	- the first object to be compared
<i>o2</i>	- the second object to be compared

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implemented in `decaf::util::comparators::Less< E >` (p. 2400).

6.205.3.2 `template<typename T> virtual bool decaf::util::Comparator< T >::operator() (const T & left, const T & right) const [pure virtual]`

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1251) to be passed to an STL **Map** (p. 2538) for use as the sorting criteria.

Parameters

<i>left</i>	- the Left hand side operand.
<i>right</i>	- the Right hand side operand.

Returns

true if the vale of left is less than the value of right.

Implemented in **decaf::util::comparators::Less< E >** (p. 2401).

6.208.2.2 **virtual activemq::threads::CompositeTaskRunner::~~CompositeTaskRunner** ()
[virtual]

6.208.3 Member Function Documentation

6.208.3.1 **void activemq::threads::CompositeTaskRunner::addTask** (**CompositeTask** * *task*)

Adds a new **CompositeTask** (p. 1255) to the Set of Tasks that this class manages.

Parameters

<i>task</i>	- Pointer to a CompositeTask (p. 1255) instance.
-------------	---

6.208.3.2 **virtual bool activemq::threads::CompositeTaskRunner::iterate** ()
[protected, virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implements **activemq::threads::Task** (p. 3847).

6.208.3.3 `void activemq::threads::CompositeTaskRunner::removeTask (CompositeTask * task)`

Removes a **CompositeTask** (p. 1255) that was added previously.

Parameters

<i>task</i>	- Pointer to a CompositeTask (p. 1255) instance.
-------------	---

6.208.3.4 `virtual void activemq::threads::CompositeTaskRunner::run ()` [protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 3419).

6.208.3.5 `virtual void activemq::threads::CompositeTaskRunner::shutdown ()` [virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implements **activemq::threads::TaskRunner** (p. 3849).

6.208.3.6 `virtual void activemq::threads::CompositeTaskRunner::shutdown (unsigned int timeout)` [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

<i>timeout</i>	- Time in Milliseconds to wait for the task to stop.
----------------	--

Implements **activemq::threads::TaskRunner** (p. 3849).

6.208.3.7 `virtual void activemq::threads::CompositeTaskRunner::wakeup ()` [virtual]

Signal the **TaskRunner** (p. 3849) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3846) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 3850).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**CompositeTaskRunner.h**

6.209 activemq::transport::CompositeTransport Class Reference

A Composite **Transport** (p. 3996) is a **Transport** (p. 3996) implementation that is composed of several Transports.

```
#include <src/main/activemq/transport/CompositeTransport.h>
```

Inheritance diagram for activemq::transport::CompositeTransport:

Public Member Functions

- virtual **~CompositeTransport** ()
- virtual void **addURI** (const **List**< **URI** > &uris)=0
*Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3996) is a composite of.*
- virtual void **removeURI** (const **List**< **URI** > &uris)=0
*Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3996) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3996) should result in that **Transport** (p. 3996) being disposed of.*

6.209.1 Detailed Description

A Composite **Transport** (p. 3996) is a **Transport** (p. 3996) implementation that is composed of several Transports. The composition could be such that only one **Transport** (p. 3996) exists for each URI that is composed or there could be many active Transports working at once.

Since

3.0

6.209.2 Constructor & Destructor Documentation

6.209.2.1 virtual activemq::transport::CompositeTransport::~~CompositeTransport ()
[inline, virtual]

6.209.3 Member Function Documentation

6.209.3.1 virtual void activemq::transport::CompositeTransport::addURI (const **List**< **URI** > & *uris*) [pure virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3996) is a composite of.

Parameters

<i>uris</i>	The new URI set to add to the set this composite maintains.
-------------	---

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1933).

6.209.3.2 virtual void activemq::transport::CompositeTransport::removeURI (const List< URI > & *uris*) [pure virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3996) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3996) should result in that **Transport** (p. 3996) being disposed of.

Parameters

<i>uris</i>	The new URI set to remove to the set this composite maintains.
-------------	--

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1938).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/CompositeTransport.h

6.210 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR > Class Template Reference

Interface for a **Map** (p. 2538) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 2538) interface.

```
#include <src/main/decaf/util/concurrent/ConcurrentMap.h>
```

Inheritance diagram for decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >:

Public Member Functions

- virtual **~ConcurrentMap** ()
- virtual bool **putIfAbsent** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::Unsupported)

If the specified key is not already associated with a value, associate it with the given value.

- virtual bool **remove** (const K &key, const V &value)=0

Remove entry for key only if currently mapped to given value.

6.210 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR > Class Template Reference 1261

- virtual bool **replace** (const K &key, const V &oldValue, const V &newValue)=0

Replace entry for key only if currently mapped to given value.

- virtual V **replace** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::NoSuchElementException)

Replace entry for key only if currently mapped to some value.

6.210.1 Detailed Description

template<typename K, typename V, typename COMPARATOR> class decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >

Interface for a **Map** (p. 2538) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 2538) interface.

Since

1.0

6.210.2 Constructor & Destructor Documentation

6.210.2.1 template<typename K, typename V, typename COMPARATOR> virtual decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::~~ConcurrentMap () [inline, virtual]

6.210.3 Member Function Documentation

6.210.3.1 template<typename K, typename V, typename COMPARATOR> virtual bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::putIfAbsent (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	The key to map the value to.
<i>value</i>	The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

<i>UnsupportedOperationException</i>	if the put operation is not supported by this map
--------------------------------------	---

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1276), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1276), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1276), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1276), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1276), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1276), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1276).

6.210.3.2 `template<typename K, typename V, typename COMPARATOR> virtual bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::remove (const K & key, const V & value) [pure virtual]`

Remove entry for key only if currently mapped to given value.

Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == value ) ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implemented in **decaf::util::concurrent::ConcurrentStdMap< K, V, COMPARATOR >** (p. 1277), **decaf::util::concurrent::ConcurrentStdMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1277), **decaf::util::concurrent::ConcurrentStdMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1277), **decaf::util::concurrent::ConcurrentStdMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1277), **decaf::util::concurrent::ConcurrentStdMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1277), **decaf::util::concurrent::ConcurrentStdMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1277), and **decaf::util::concurrent::ConcurrentStdMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1277).

6.210.3.3 `template<typename K, typename V, typename COMPARATOR> virtual bool
 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::replace (
 const K & key, const V & oldValue, const V & newValue) [pure virtual]`

Replace entry for key only if currently mapped to given value.

Acts as

```
if ( ( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>oldValue</i>	value expected to be associated with the specified key.
<i>newValue</i>	value to be associated with the specified key.

Returns

true if the value was replaced

Implemented in **decaf::util::concurrent::ConcurrentStdMap< K, V, COMPARATOR >** (p. 1279), **decaf::util::concurrent::ConcurrentStdMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1279), **decaf::util::concurrent::ConcurrentStdMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1279), **decaf::util::concurrent::ConcurrentStdMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1279), **decaf::util::concurrent::ConcurrentStdMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1279), **decaf::util::concurrent::ConcurrentStdMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1279), and **decaf::util::concurrent::ConcurrentStdMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1279).

(p. 1279), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1279), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1279).

6.210.3.4 `template<typename K, typename V, typename COMPARATOR>`
`virtual V decaf::util::concurrent::ConcurrentMap< K, V,`
`COMPARATOR >::replace (const K & key, const V & value) throw (`
`decaf::lang::exceptions::NoSuchElementException) [pure`
`virtual]`

Replace entry for key only if currently mapped to some value.

Acts as

```
if( ( map.containsKey( key ) ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException(...);
};
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an `NoSuchElementException` if there was no mapping for key.

Exceptions

<i>NoSuchElementException</i>	if there was no previous mapping.
-------------------------------	-----------------------------------

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1278), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1278), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1278), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1278), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1278), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1278), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1278).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/ConcurrentMap.h

6.211 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference

Map (p. 2538) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

```
#include <src/main/decaf/util/concurrent/ConcurrentStlMap.h>
```

Inheritance diagram for decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >:

Public Member Functions

- **ConcurrentStlMap** ()
Default constructor - does nothing.
- **ConcurrentStlMap** (const **ConcurrentStlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **ConcurrentStlMap** (const **Map**< K, V, COMPARATOR > &source)
Copy constructor - copies the content of the given map into this one.
- virtual ~**ConcurrentStlMap** ()
- virtual bool **equals** (const **ConcurrentStlMap** &source) const
- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const
Comparison, equality is dependent on the method of determining if the element are equal.
- virtual void **copy** (const **ConcurrentStlMap** &source)
- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)
Copies the content of the source map into this map.
- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
Exceptions

UnsupportedOperation Exception	<i>if this map is unmodifiable.</i>
-----------------------------------	-------------------------------------

- virtual bool **containsKey** (const K &key) const

Indicates whether or this map contains a value for the given key.

Parameters

key	<i>The key to look up.</i>
-----	----------------------------

Returns

true if this map contains the value, otherwise false.

- virtual bool **containsValue** (const V &value) const

Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value	<i>The Value to look up.</i>
-------	------------------------------

Returns

true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () const

Returns

*if the **Map** (p. 2538) contains any element or not, TRUE or FALSE*

- virtual std::size_t **size** () const

Returns

The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key) throw (lang::exceptions::NoSuchElementException)

*Gets the value mapped to the specified key in the **Map** (p. 2538).*

If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

Parameters

key	<i>The search key.</i>
-----	------------------------

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException	<i>if the key requests doesn't exist in the Map (p. 2538).</i>
------------------------	---

- virtual const V & **get** (const K &key) const throw (lang::exceptions::NoSuchElementException)

)

*Gets the value mapped to the specified key in the **Map** (p. 2538).
 If there is no element in the map whose key is equivalent to the key provided then a
 NoSuchElementException is thrown.*

Parameters

key	The search key.
-----	-----------------

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementExcep- tion	if the key requests doesn't exist in the Map (p. 2538).
-----------------------------	--

- virtual void **put** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

Sets the value for the specified key.

Parameters

key	The target key.
value	The value to be set.

Exceptions

UnsupportedOpera- tionException	if this map is unmodifiable.
------------------------------------	------------------------------

- virtual void **putAll** (const **ConcurrentStdMap**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

*Stores a copy of the Mappings contained in the other **Map** (p. 2538) in this one.*

Parameters

other	A Map (p. 2538) instance whose elements are to all be inserted in this Map (p. 2538).
-------	---

Exceptions

UnsupportedOpera- tionException	If the implementing class does not support the putAll operation.
------------------------------------	--

- virtual V **remove** (const K &key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

*Removes the value (key/value pair) for the specified key from the map, returns a copy
 of the value that was mapped to the key.*

Parameters

key	The search key.
-----	-----------------

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException	if this key is not in the Map (p. 2538).
UnsupportedOperationException	if this map is unmodifiable.

- virtual std::vector< K > **keySet** () const

*Returns a **Set** (p. 3538) view of the mappings contained in this map.*

*The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 2223), **Set.remove** (p. 168), removeAll, retainAll and clear operations. It does not support the add or addAll operations.*

Returns

the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () const

Returns

the entire set of values in this map as a std::vector.

- bool **putIfAbsent** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

If the specified key is not already associated with a value, associate it with the given value.

- bool **remove** (const K &key, const V &value)

Remove entry for key only if currently mapped to given value.

- bool **replace** (const K &key, const V &oldValue, const V &newValue)

Replace entry for key only if currently mapped to given value.

- V **replace** (const K &key, const V &value) throw (decaf::lang::exceptions::NoSuchElementException)

Replace entry for key only if currently mapped to some value.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

*Attempts to **Lock** (p. 2450) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.211.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>> class decaf::util::concurrent::ConcurrentStlMap<
K, V, COMPARATOR >
```

Map (p. 2538) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map. This version of **Map** (p. 2538) extends the **ConcurrentMap** (p. 1260) interface and implements all the methods defined in that interface. Unlike a Java ConcurrentHashMap this implementation synchronizes all methods such that any call to this class will block if another thread is already holding a lock, much like the Java HashTable.

Since

1.0

6.211.2 Constructor & Destructor Documentation

```
6.211.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>>
decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::ConcurrentStlMap ( ) [inline]
```

Default constructor - does nothing.

```

6.211.2.2  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
            >::ConcurrentStlMap ( const ConcurrentStlMap< K, V, COMPARATOR > &
            source ) [inline]

```

Copy constructor - copies the content of the given map into this one.

Parameters

<i>source</i>	The source map.
---------------	-----------------

```

6.211.2.3  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
            >::ConcurrentStlMap ( const Map< K, V, COMPARATOR > & source )
            [inline]

```

Copy constructor - copies the content of the given map into this one.

Parameters

<i>source</i>	The source map.
---------------	-----------------

```

6.211.2.4  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
            >::~~ConcurrentStlMap ( ) [inline, virtual]

```

6.211.3 Member Function Documentation

```

6.211.3.1  template<typename K, typename V, typename
            COMPARATOR = std::less<K>> virtual void
            decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::clear (
            ) throw ( decaf::lang::exceptions::UnsupportedOperationException )
            [inline, virtual]

```

Removes all keys and values from this map.

Exceptions

<i>UnsupportedOperation Exception</i>	if this map is unmodifiable.
---	------------------------------

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2540).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy()`.

6.211 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference 1271

6.211.3.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::containsKey (const K & key) const [inline, virtual]`

Indicates whether or this map contains a value for the given key.

Parameters

<i>key</i>	The key to look up.
------------	---------------------

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2541).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::remove()`, and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace()`.

6.211.3.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::containsValue (const V & value) const [inline,
virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by `operator==` so the types must pass equivalence testing in this manner.

Parameters

<i>value</i>	The Value to look up.
--------------	-----------------------

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2542).

6.211.3.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::copy (const ConcurrentStlMap< K, V, COMPARATOR > &
source) [inline, virtual]`

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::ConcurrentStlMap()`.

```
6.211.3.5  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::copy ( const Map< K, V, COMPARATOR > & source )
[inline, virtual]
```

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

<i>source</i>	The source object to copy from.
---------------	---------------------------------

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 2543).

```
6.211.3.6  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::equals ( const Map< K, V, COMPARATOR > & source ) const
[inline, virtual]
```

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

<i>source</i>	- Map (p. 2538) to compare to this one.
---------------	--

Returns

true if the **Map** (p. 2538) passed is equal in value to this one.

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 2543).

```
6.211.3.7  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::equals ( const ConcurrentStlMap< K, V, COMPARATOR > &
source ) const [inline, virtual]
```

```
6.211.3.8  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::get ( const K & key ) throw ( lang::exceptions::NoSuchElementException
) [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 2538).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** is thrown.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

A reference to the value for the given key.

Exceptions

<i>NoSuchElementException</i>	if the key requests doesn't exist in the Map (p. 2538).
-------------------------------	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2543).

```
6.211.3.9  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual const V& decaf::util::concurrent::ConcurrentStdMap<
            K, V, COMPARATOR >::get ( const K & key ) const throw (
            lang::exceptions::NoSuchElementException ) [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 2538).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** is thrown.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

A {const} reference to the value for the given key.

Exceptions

<i>NoSuchElementException</i>	if the key requests doesn't exist in the Map (p. 2538).
-------------------------------	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2544).

```
6.211.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::concurrent::ConcurrentStdMap< K, V,
            COMPARATOR >::isEmpty ( ) const [inline, virtual]
```

Returns

if the **Map** (p. 2538) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2545).

```
6.211.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual std::vector<K> decaf::util::concurrent::ConcurrentStdMap< K, V,
            COMPARATOR >::keySet ( ) const [inline, virtual]
```

Returns a **Set** (p. 3538) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 2223), **Set.remove** (p. 168), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns

the entire set of keys in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2546).

```
6.211.3.12 template<typename K, typename V, typename
COMPARATOR = std::less<K>> virtual void
decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::lock (
) throw ( decaf::lang::exceptions::RuntimeException ) [inline,
virtual]
```

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3812).

```
6.211.3.13 template<typename K, typename V, typename
COMPARATOR = std::less<K>> virtual void
decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::notify ( ) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException ) [inline,
virtual]
```

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 3811) Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3813).

6.211.3.14 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
 virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::notifyAll () throw (
 decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [inline,
 virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 3811) Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3814).

6.211.3.15 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
 virtual void decaf::util::concurrent::ConcurrentStlMap< K,
 V, COMPARATOR >::put (const K & key, const V & value) throw (
 decaf::lang::exceptions::UnsupportedOperationException)
 [inline, virtual]`

Sets the value for the specified key.

Parameters

<i>key</i>	The target key.
<i>value</i>	The value to be set.

Exceptions

<i>UnsupportedOperationException</i>	if this map is unmodifiable.
--------------------------------------	------------------------------

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2547).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >,
 Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll()`, `decaf::util::concurrent::ConcurrentStlMap<
 Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent()`,
 and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< Pro-
 ducerState >, ProducerId::COMPARATOR >::replace()`.

```

6.211.3.16  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::putAll ( const Map< K, V, COMPARATOR > & other )
throw ( decaf::lang::exceptions::UnsupportedOperationException )
[inline, virtual]

```

Stores a copy of the Mappings contained in the other **Map** (p. 2538) in this one.

Parameters

<i>other</i>	A Map (p. 2538) instance whose elements are to all be inserted in this Map (p. 2538).
--------------	---

Exceptions

<i>UnsupportedOperationException</i>	If the implementing class does not support the putAll operation.
--------------------------------------	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2548).

```

6.211.3.17  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::putAll ( const ConcurrentStlMap< K, V, COMPARATOR > &
other ) throw ( decaf::lang::exceptions::UnsupportedOperationException
) [inline, virtual]

```

Referenced by **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy()**.

```

6.211.3.18  template<typename K, typename V, typename COMPARATOR = std::less<K>>
bool decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::putIfAbsent ( const K & key, const V & value ) throw
( decaf::lang::exceptions::UnsupportedOperationException )
[inline, virtual]

```

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```

if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}

```

except that the action is performed atomically.

6.211 decaf::util::concurrent::ConcurrentStdMap< K, V, COMPARATOR > Class Template Reference 1277

Parameters

<i>key</i>	The key to map the value to.
<i>value</i>	The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

<i>UnsupportedOperationException</i>	if the put operation is not supported by this map
--------------------------------------	---

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 1261).

6.211.3.19 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
bool decaf::util::concurrent::ConcurrentStdMap< K, V, COMPARATOR
>::remove (const K & key, const V & value) [inline, virtual]`

Remove entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == value ) ) {  
    map.remove( key );  
    return true;  
} else {  
    return false;  
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 1262).

```

6.211.3.20  template<typename K, typename V, typename COMPARTOR =
std::less<K>> virtual V decaf::util::concurrent::ConcurrentStlMap<
K, V, COMPARTOR >::remove ( const K & key ) throw (
decaf::lang::exceptions::NoSuchElementException,
decaf::lang::exceptions::UnsupportedOperationException )
[inline, virtual]

```

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

a copy of the element that was previously mapped to the given key

Exceptions

<i>NoSuchElementException</i>	if this key is not in the Map (p. 2538).
<i>UnsupportedOperationException</i>	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARTOR >** (p. 2548).

```

6.211.3.21  template<typename K, typename V, typename COMPARTOR =
std::less<K>> V decaf::util::concurrent::ConcurrentStlMap<
K, V, COMPARTOR >::replace ( const K & key, const V & value ) throw (
decaf::lang::exceptions::NoSuchElementException ) [inline,
virtual]

```

Replace entry for key only if currently mapped to some value.

Acts as

```

if( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException(...);
};

```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an `NoSuchElementException` if there was no mapping for key.

Exceptions

<i>NoSuchElementException</i>	if there was no previous mapping.
-------------------------------	-----------------------------------

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 1264).

6.211.3.22 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
bool decaf::util::concurrent::ConcurrentStdMap< K, V, COMPARATOR
>::replace (const K & key, const V & oldValue, const V & newValue)
[inline, virtual]`

Replace entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>oldValue</i>	value expected to be associated with the specified key.
<i>newValue</i>	value to be associated with the specified key.

Returns

true if the value was replaced

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 1263).

6.211.3.23 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual std::size_t decaf::util::concurrent::ConcurrentStdMap< K, V,
COMPARATOR >::size () const [inline, virtual]`

Returns

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2549).

```
6.211.3.24  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::concurrent::ConcurrentStlMap<
            K, V, COMPARATOR >::tryLock (    ) throw (
            decaf::lang::exceptions::RuntimeException ) [inline, virtual]
```

Attempts to **Lock** (p. 2450) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3815).

```
6.211.3.25  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::concurrent::ConcurrentStlMap<
            K, V, COMPARATOR >::unlock (    ) throw (
            decaf::lang::exceptions::RuntimeException ) [inline, virtual]
```

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3816).

```
6.211.3.26  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual std::vector<V> decaf::util::concurrent::ConcurrentStlMap< K, V,
            COMPARATOR >::values (    ) const [inline, virtual]
```

Returns

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2550).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::values().

6.211.3.27 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
 virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::wait (long long millisecs) throw
 (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException,
 decaf::lang::exceptions::InterruptedException) [inline,
 virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 3811) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3819).

6.211.3.28 `template<typename K, typename V, typename
 COMPARATOR = std::less<K>> virtual void
 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
 >::wait () throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException,
 decaf::lang::exceptions::InterruptedException) [inline,
 virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 3811) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3818).

```

6.211.3.29  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap<
K, V, COMPARATOR >::wait ( long long millisecs, int nanos
) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException ) [inline,
virtual]

```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INIFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgumentEx- ception</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState- Exception</i>	- if the current thread is not the owner of the the Synchronizable (p. 3811) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3820).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/ConcurrentStlMap.h

6.212 decaf::util::concurrent::locks::Condition Class Reference

Condition (p. 1282) factors out the **Mutex** (p. 2866) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 2452) implementations.

6.212.1 Detailed Description

Condition (p. 1282) factors out the **Mutex** (p. 2866) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 2452) implementations. Where a **Lock** (p. 2452) replaces the use of synchronized statements, a **Condition** (p. 1282) replaces the use of the Object monitor methods.

Conditions (also known as condition queues or condition variables) provide a means for one thread to suspend execution (to "wait") until notified by another thread that some state condition may now be true. Because access to this shared state information occurs in different threads, it must be protected, so a lock of some form is associated

with the condition. The key property that waiting for a condition provides is that it atomically releases the associated lock and suspends the current thread.

A **Condition** (p. 1282) instance is intrinsically bound to a lock. To obtain a **Condition** (p. 1282) instance for a particular **Lock** (p. 2452) instance use its `newCondition()` method.

As an example, suppose we have a bounded buffer which supports `put` and `take` methods. If a `take` is attempted on an empty buffer, then the thread will block until an item becomes available; if a `put` is attempted on a full buffer, then the thread will block until a space becomes available. We would like to keep waiting `put` threads and `take` threads in separate wait-sets so that we can use the optimization of only notifying a single thread at a time when items or spaces become available in the buffer. This can be achieved using two **Condition** (p. 1282) instances.

```
class BoundedBuffer { Lock* lock = new ReentrantLock(); Condition* notFull = lock->newCondition(); Condition* notEmpty = lock->newCondition();
```

```
Object* items = new Object[100]; int putptr, takeptr, count;
```

```
public void put( Object* x ) throw( InterruptedException ) { lock->lock(); try { while( count == 100 ) notFull->await() (p. 1285); items[putptr] = x; if (++putptr == 100) putptr = 0; ++count; notEmpty->signal() (p. 1289); } catch(...) { lock->unlock(); } }
```

```
public Object take() throw( InterruptedException ) { lock->lock(); try { while(count == 0) notEmpty->await() (p. 1285); Object x = items[takeptr]; if (++takeptr == 100) takeptr = 0; --count; notFull->signal() (p. 1289); return x; } catch(...) { lock->unlock(); } } }
```

(The `ArrayBlockingQueue` class provides this functionality, so there is no reason to implement this sample usage class.)

Implementation Considerations

When waiting upon a **Condition** (p. 1282), a "spurious wakeup" is permitted to occur, in general, as a concession to the underlying platform semantics. This has little practical impact on most application programs as a **Condition** (p. 1282) should always be waited upon in a loop, testing the state predicate that is being waited for. An implementation is free to remove the possibility of spurious wakeups but it is recommended that applications programmers always assume that they can occur and so always wait in a loop.

The three forms of condition waiting (interruptible, non-interruptible, and timed) may differ in their ease of implementation on some platforms and in their performance characteristics. In particular, it may be difficult to provide these features and maintain specific semantics such as ordering guarantees. Further, the ability to interrupt the actual suspension of the thread may not always be feasible to implement on all platforms.

Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of waiting, nor is it required to support interruption of the actual suspension of the thread.

An implementation is required to clearly document the semantics and guarantees provided by each of the waiting methods, and when an implementation does support interruption of thread suspension then it must obey the interruption semantics as defined in this interface.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since

1.0

6.212.2 Constructor & Destructor Documentation

6.212.2.1 `virtual decaf::util::concurrent::locks::Condition::~~Condition () [inline, virtual]`

6.212.3 Member Function Documentation

6.212.3.1 `virtual void decaf::util::concurrent::locks::Condition::await ()
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::IllegalMonitorStateException) [pure
virtual]`

Causes the current thread to wait until it is signaled or interrupted.

The lock associated with this **Condition** (p. 1282) is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

- * Some other thread invokes the **signal()** (p. 1289) method for this **Condition** (p. 1282) and the current thread happens to be chosen as the thread to be awakened; or
- * Some other thread invokes the **signalAll()** (p. 1289) method for this **Condition** (p. 1282); or
- * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or
- * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while waiting and interruption of thread suspension is supported,

then **InterruptedException** is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1282) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as **IllegalMonitorStateException**) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal. In that case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 1282).
<i>InterruptedException</i>	if the current thread is interrupted (and interruption of thread suspension is supported)
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

6.212.3.2 `virtual bool decaf::util::concurrent::locks::Condition::await (long long time, const TimeUnit & unit) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]`

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

This method is behaviorally equivalent to:

`awaitNanos(unit.toNanos(time)) > 0`

Parameters

<i>time</i>	- the maximum time to wait
<i>unit</i>	- the time unit of the time argument

Returns

false if the waiting time detectably elapsed before return from the method, else true

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 1282).
<i>InterruptedException</i>	if the current thread is interrupted (and interruption of thread suspension is supported)
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

```
6.212.3.3 virtual long long decaf::util::concurrent::locks::Condition::awaitNanos ( long long
nanosTimeout ) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::IllegalMonitorStateException ) [pure
virtual]
```

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of five things happens:

- * Some other thread invokes the **signal()** (p. 1289) method for this **Condition** (p. 1282) and the current thread happens to be chosen as the thread to be awakened; or
- * Some other thread invokes the **signalAll()** (p. 1289) method for this **Condition** (p. 1282); or
- * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or
- * The specified waiting time elapses; or
- * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while waiting and interruption of thread suspension is supported,

then **InterruptedException** is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

The method returns an estimate of the number of nanoseconds remaining to wait given the supplied **nanosTimeout** value upon return, or a value less than or equal to zero if it timed out. This value can be used to determine whether and how long to re-wait in cases where the wait returns but an awaited condition still does not hold. Typical uses of this method take the following form:

```
synchronized boolean aMethod( long timeout, const TimeUnit& unit ) { long nanos-
Timeout = unit.toNanos(timeout); while (!conditionBeingWaitedFor) { if (nanosTime-
out > 0) nanosTimeout = theCondition->awaitNanos(nanosTimeout); else return false;
} // ... }
```

Design note: This method requires a nanosecond argument so as to avoid truncation errors in reporting remaining times. Such precision loss would make it difficult for programmers to ensure that total waiting times are not systematically shorter than specified when re-waits occur.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1282) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as **IllegalMonitorStateException**) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return

in response to a signal, or over indicating the elapse of the specified waiting time. In either case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Parameters

<i>nanosTimeout</i>	- the maximum time to wait, in nanoseconds
---------------------	--

Returns

an estimate of the nanosTimeout value minus the time spent waiting upon return from this method. A positive value may be used as the argument to a subsequent call to this method to finish waiting out the desired time. A value less than or equal to zero indicates that no time remains.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 1282).
<i>InterruptedException</i>	if the current thread is interrupted (and interruption of thread suspension is supported)
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

```
6.212.3.4  virtual void decaf::util::concurrent::locks::Condition::awaitUninterruptibly
( ) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException ) [pure
virtual]
```

Causes the current thread to wait until it is signalled.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * Some other thread invokes the **signal()** (p. 1289) method for this **Condition** (p. 1282) and the current thread happens to be chosen as the thread to be awakened; or
- * Some other thread invokes the **signalAll()** (p. 1289) method for this **Condition** (p. 1282); or
- * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread's interrupted status is set when it enters this method, or it is interrupted while waiting, it will continue to wait until signalled. When it finally returns from this method its interrupted status will still be set.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1282) when this method is called. It is up to the implementation to determine if this is the

case and if not, how to respond. Typically, an exception will be thrown (such as `IllegalMonitorStateException`) and the implementation must document that fact.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 1282).
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

6.212.3.5 `virtual bool decaf::util::concurrent::locks::Condition::awaitUntil (const Date & deadline) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]`

6.212.3.6 `virtual void decaf::util::concurrent::locks::Condition::signal () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]`

Wakes up one waiting thread.

If any threads are waiting on this condition then one is selected for waking up. That thread must then re-acquire the lock before returning from await.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 1282).
-------------------------	---

6.212.3.7 `virtual void decaf::util::concurrent::locks::Condition::signalAll () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]`

Wakes up all waiting threads.

If any threads are waiting on this condition then they are all woken up. Each thread must re-acquire the lock before it can return from await.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 1282).
-------------------------	---

Destroy a previously create Condition instance.
- static void `wait (decaf::util::concurrent::ConditionHandle *condition)`

Waits for the condition to be signaled.

- static void **wait** (**decaf::util::concurrent::ConditionHandle** *condition, long long mills, long long nanos)

Waits for the condition to be signaled or for the time specified to ellapse.

- static void **notify** (**decaf::util::concurrent::ConditionHandle** *condition)

Signals one Thread that is waiting on this condition to wake up.

- static void **notifyAll** (**decaf::util::concurrent::ConditionHandle** *condition)

Signals all Threads that is waiting on this condition to wake up.

6.214.1 Member Function Documentation

6.214.1.1 static decaf::util::concurrent::ConditionHandle* decaf::internal::util::concurrent::ConditionImpl::create (decaf::util::concurrent::MutexHandle * mutex) [static]

Creates the Condition object and attaches it to the given MutexHandle.

Parameters

<i>mutex</i>	the Mutex handle that this Condition is attached to.
--------------	--

Returns

a newly constructed Condition handle that is attached to the given handle.

6.214.1.2 static void decaf::internal::util::concurrent::ConditionImpl::destroy (decaf::util::concurrent::ConditionHandle * handle) [static]

Destroy a previously create Condition instance.

Parameters

<i>handle</i>	The Condition handle to be destroyed.
---------------	---------------------------------------

6.214.1.3 static void decaf::internal::util::concurrent::ConditionImpl::notify (decaf::util::concurrent::ConditionHandle * condition) [static]

Signals one Thread that is waiting on this condition to wake up.

Parameters

<i>condition</i>	the handle to the condition to wait on.
------------------	---

6.214.1.4 `static void decaf::internal::util::concurrent::ConditionImpl::notifyAll (decaf::util::concurrent::ConditionHandle * condition) [static]`

Signals all Threads that is waiting on this condition to wake up.

Parameters

<i>condition</i>	the handle to the condition to wait on.
------------------	---

6.214.1.5 `static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * condition, long long mills, long long nanos) [static]`

Waits for the condition to be signaled or for the time specified to ellapse.

Parameters

<i>condition</i>	the handle to the condition to wait on.
<i>mills</i>	the time in milliseconds to wait for the condition to be signaled.
<i>nanos</i>	additional time in nanoseconds to wait for the thread to be signaled.

6.214.1.6 `static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * condition) [static]`

Waits for the condition to be signaled.

Parameters

<i>condition</i>	the handle to the condition to wait on.
------------------	---

6.215.1 Constructor & Destructor Documentation

6.215.1.1 decaf::net::ConnectException::ConnectException () throw () [inline]

Default Constructor.

6.215.1.2 decaf::net::ConnectException::ConnectException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.215.1.3 decaf::net::ConnectException::ConnectException (const ConnectException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.215.1.4 `decaf::net::ConnectException::ConnectException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.
Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.215.1.5 `decaf::net::ConnectException::ConnectException (const std::exception * cause)`
`throw ()` `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.215.1.6 `decaf::net::ConnectException::ConnectException (const char * file, const int lineNumber, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.
Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.215.1.7 **virtual** `decaf::net::ConnectException::~~ConnectException () throw ()`
`[inline, virtual]`

6.215.2 Member Function Documentation

6.215.2.1 **virtual** `ConnectException*` `decaf::net::ConnectException::clone () const`
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new `Exception` instance that is a copy of this `Exception` object.

Reimplemented from `decaf::net::SocketException` (p. 3629).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ConnectException.h`

6.216 cms::Connection Class Reference

The client's connection to its provider.

```
#include <src/main/cms/Connection.h>
```

Inheritance diagram for `cms::Connection`:

Public Member Functions

- **virtual** `~Connection ()`
- **virtual void** `close ()=0 throw (CMSEException)`
Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).
- **virtual const** `ConnectionMetaData*` `getMetaData () const =0 throw (CMSEException)`
Gets the metadata for this connection.
- **virtual** `Session*` `createSession ()=0 throw (CMSEException)`
Creates an AUTO_ACKNOWLEDGE Session (p. 3460).
- **virtual** `Session*` `createSession (Session::AcknowledgeMode ackMode)=0 throw (CMSEException)`

*Creates a new **Session** (p. 3460) to work for this **Connection** (p. 1296) using the specified acknowledgment mode.*

- virtual std::string **getClientID** () const =0

*Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the **setClientID** method.*

- virtual void **setClientID** (const std::string &clientID)=0

Sets the client identifier for this connection.

- virtual **ExceptionListener** * **getExceptionListener** () const =0

Gets the registered Exception Listener for this connection.

- virtual void **setExceptionListener** (**ExceptionListener** *listener)=0

Sets the registered Exception Listener for this connection.

6.216.1 Detailed Description

The client's connection to its provider. Connections support concurrent use.

A connection serves several purposes:

- It encapsulates an open connection with a JMS provider. It typically represents an open TCP/IP socket between a client and the service provider software.
- Its creation is where client authentication takes place.
- It can specify a unique client identifier.
- It provides a **ConnectionMetaData** (p. 1425) object.
- It supports an optional **ExceptionListener** (p. 1893) object.

Because the creation of a connection involves setting up authentication and communication, a connection is a relatively heavy-weight object. Most clients will do all their messaging with a single connection. Other more advanced applications may use several connections. The CMS API does not architect a reason for using multiple connections; however, there may be operational reasons for doing so.

A CMS client typically creates a connection, one or more sessions, and a number of message producers and consumers. When a connection is created, it is in stopped mode. That means that no messages are being delivered.

It is typical to leave the connection in stopped mode until setup is complete (that is, until all message consumers have been created). At that point, the client calls the connection's start method, and messages begin arriving at the connection's consumers. This setup convention minimizes any client confusion that may result from asynchronous message delivery while the client is still in the process of setting itself up.

A connection can be started immediately, and the setup can be done afterwards. Clients that do this must be prepared to handle asynchronous message delivery while they are still in the process of setting up.

A message producer can send messages while a connection is stopped.

Since

1.0

6.216.2 Constructor & Destructor Documentation

6.216.2.1 `virtual cms::Connection::~~Connection () [inline, virtual]`

6.216.3 Member Function Documentation

6.216.3.1 `virtual void cms::Connection::close () throw (CMSEException) [pure virtual]`

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions

<i>CMSEException</i> (p. 1190)
--

Implements **cms::Closeable** (p. 1180).

Implemented in **activemq::core::ActiveMQConnection** (p. 267).

6.216.3.2 `virtual Session* cms::Connection::createSession (Session::AcknowledgeMode ackMode) throw (CMSEException) [pure virtual]`

Creates a new **Session** (p. 3460) to work for this **Connection** (p. 1296) using the specified acknowledgment mode.

Parameters

<i>ackMode</i>	the Acknowledgment Mode to use.
----------------	---------------------------------

Exceptions

<i>CMSEException</i> (p. 1190)
--

Implemented in **activemq::core::ActiveMQConnection** (p. 267).

6.216.3.3 `virtual Session* cms::Connection::createSession () throw (CMSEException)`
[pure virtual]

Creates an AUTO_ACKNOWLEDGE Session (p. 3460).

Exceptions

<i>CMSEException</i> (p. 1190)	
--	--

Implemented in **activemq::core::ActiveMQConnection** (p. 268).

6.216.3.4 `virtual std::string cms::Connection::getClientID () const` [pure virtual]

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

Returns

Client Id String for this **Connection** (p. 1296).

Exceptions

<i>CMSEException</i> (p. 1190)	if the provider fails to return the client id or an internal error occurs.
--	--

Implemented in **activemq::core::ActiveMQConnection** (p. 270).

6.216.3.5 `virtual ExceptionListener* cms::Connection::getExceptionListener () const`
[pure virtual]

Gets the registered Exception Listener for this connection.

Returns

pointer to an exception listener or NULL

Implemented in **activemq::core::ActiveMQConnection** (p. 270).

6.216.3.6 `virtual const ConnectionMetaData* cms::Connection::getMetaData () const`
`throw (CMSEException)` [pure virtual]

Gets the metadata for this connection.

Returns

the connection MetaData pointer (caller does not own it).

Exceptions

<i>CMSException</i> (p. 1190)	if the provider fails to get the connection metadata for this connection.
---	---

See also

ConnectionMetaData (p. 1425)

Since

2.0

Implemented in **activemq::core::ActiveMQConnection** (p. 271).

6.216.3.7 `virtual void cms::Connection::setClientID (const std::string & clientID)` [pure virtual]

Sets the client identifier for this connection.

The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 1361) object and transparently assigned to the **Connection** (p. 1296) object it creates.

If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 2059).

Parameters

<i>clientID</i>	The unique client identifier to assign to the Connection (p. 1296).
-----------------	--

Exceptions

<i>CMSException</i> (p. 1190)	if the provider fails to set the client id due to some internal error.
<i>InvalidClientIDException</i>	if the id given is somehow invalid or is a duplicate.
<i>IllegalStateException</i> (p. 2059)	if the client tries to set the id after a Connection (p. 1296) method has been called.

Implemented in **activemq::core::ActiveMQConnection** (p. 277).

6.216.3.8 `virtual void cms::Connection::setExceptionListener (ExceptionListener * listener)` [pure virtual]

Sets the registered Exception Listener for this connection.

Parameters

<i>listener</i>	pointer to and ExceptionListener (p. 1893)
-----------------	---

Implemented in **activemq::core::ActiveMQConnection** (p. 278).

The documentation for this class was generated from the following file:

- src/main/cms/Connection.h

6.217 activemq::commands::ConnectionControl Class Reference

```
#include <src/main/activemq/commands/ConnectionControl.h>
```

Inheritance diagram for **activemq::commands::ConnectionControl**:

Public Member Functions

- **ConnectionControl** ()
- virtual **~ConnectionControl** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ConnectionControl * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual bool **isClose** () const
- virtual void **setClose** (bool close)
- virtual bool **isExit** () const
- virtual void **setExit** (bool exit)
- virtual bool **isFaultTolerant** () const
- virtual void **setFaultTolerant** (bool faultTolerant)

- virtual bool **isResume** () const
- virtual void **setResume** (bool **resume**)
- virtual bool **isSuspend** () const
- virtual void **setSuspend** (bool **suspend**)
- virtual const std::string & **getConnectedBrokers** () const
- virtual std::string & **getConnectedBrokers** ()
- virtual void **setConnectedBrokers** (const std::string &**connectedBrokers**)
- virtual const std::string & **getReconnectTo** () const
- virtual std::string & **getReconnectTo** ()

- virtual bool **isRebalanceConnection** () const
- virtual void **setRebalanceConnection** (bool **rebalanceConnection**)
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_CONNECTIONCONTROL** = 18

Protected Attributes

- bool **close**
- bool **exit**
- bool **faultTolerant**
- bool **resume**
- bool **suspend**
- std::string **connectedBrokers**
- std::string **reconnectTo**
- bool **rebalanceConnection**

6.217.1 Constructor & Destructor Documentation

6.217.1.1 `activemq::commands::ConnectionControl::ConnectionControl ()`

6.217.1.2 `virtual activemq::commands::ConnectionControl::~~ConnectionControl ()`
[virtual]

6.217.2 Member Function Documentation

6.217.2.1 `virtual ConnectionControl* activemq::commands::ConnectionControl::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.217.2.2 `virtual void activemq::commands::ConnectionControl::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.217.2.3 `virtual bool activemq::commands::ConnectionControl::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.217.2.4 `virtual const std::string& activemq::commands::ConnectionControl::getConnectedBrokers () const [virtual]`

6.217.2.5 `virtual std::string& activemq::commands::ConnectionControl::getConnectedBrokers () [virtual]`

6.217.2.6 `virtual unsigned char activemq::commands::ConnectionControl::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

- 6.217.2.7 `virtual const std::string& activemq::commands::ConnectionControl::getReconnectTo () const [virtual]`
- 6.217.2.8 `virtual std::string& activemq::commands::ConnectionControl::getReconnectTo () [virtual]`
- 6.217.2.9 `virtual bool activemq::commands::ConnectionControl::isClose () const [virtual]`
- 6.217.2.10 `virtual bool activemq::commands::ConnectionControl::isExit () const [virtual]`
- 6.217.2.11 `virtual bool activemq::commands::ConnectionControl::isFaultTolerant () const [virtual]`
- 6.217.2.12 `virtual bool activemq::commands::ConnectionControl::isRebalanceConnection () const [virtual]`
- 6.217.2.13 `virtual bool activemq::commands::ConnectionControl::isResume () const [virtual]`
- 6.217.2.14 `virtual bool activemq::commands::ConnectionControl::isSuspend () const [virtual]`
- 6.217.2.15 `virtual void activemq::commands::ConnectionControl::setClose (bool close) [virtual]`
- 6.217.2.16 `virtual void activemq::commands::ConnectionControl::setConnectedBrokers (const std::string & connectedBrokers) [virtual]`
- 6.217.2.17 `virtual void activemq::commands::ConnectionControl::setExit (bool exit) [virtual]`
- 6.217.2.18 `virtual void activemq::commands::ConnectionControl::setFaultTolerant (bool faultTolerant) [virtual]`
- 6.217.2.19 `virtual void activemq::commands::ConnectionControl::setRebalanceConnection (bool rebalanceConnection) [virtual]`
- 6.217.2.20 `virtual void activemq::commands::ConnectionControl::setReconnectTo (const std::string & reconnectTo) [virtual]`
- 6.217.2.21 `virtual void activemq::commands::ConnectionControl::setResume (bool resume) [virtual]`
- 6.217.2.22 `virtual void activemq::commands::ConnectionControl::setSuspend (bool suspend) [virtual]`
- 6.217.2.23 `virtual std::string activemq::commands::ConnectionControl::toString () const [virtual]`

Generated on Sat, Mar 26 2011 07:19:23 for activemq-cpp-3.2.5 by Doxygen

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

6.217.2.24 `virtual Pointer<Command> activemq::commands::ConnectionControl::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

 () [inline]

6.218.2.2 **virtual activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::~~ConnectionControlMarshaller**
 () [inline, virtual]

6.218.3 Member Function Documentation

6.218.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::createObject**
 () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.218.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::getDataStructure**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.218.3.3 **virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::looseMarshal**
 (**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

6.218

activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller

Class Reference

1309

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

6.218.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

6.218.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

```
6.218.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

```
6.218.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.219

activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller

Class Reference

1311

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**ConnectionControlMarshaller.h**

6.219.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::createObject**
 () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.219.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::getDataStructure**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

6.219

activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller

Class Reference

1313

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.219.3.3 virtual void **activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::looseMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

6.219.3.4 virtual void **activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```

6.219.3.5  virtual int activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 782).

```

6.219.3.6  virtual void activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 783).

6.220

activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller

Class Reference

1315

6.219.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/ConnectionControlMarshaller.h

6.220 activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller Class Reference

6.220.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

6.220

activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller

Class Reference

1317

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.220.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.220.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

6.220.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

```
6.220.3.5  virtual int activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```
6.220.3.6  virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

6.221

activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller

Class Reference

1319

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

6.220.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.

6.221.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.221

activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller

Class Reference

1323

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 796).

```
6.221.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 797).

```
6.221.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.223.3 Member Function Documentation

6.223.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.223.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

```
6.223.3.3  virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

```
6.223.3.4  virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

6.223

activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller

Class Reference

1331

6.223.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

6.223.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

```
6.223.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/ConnectionControlMarshaller.h

6.224 activemq::commands::ConnectionError Class Reference

```
#include <src/main/activemq/commands/ConnectionError.h>
```

Inheritance diagram for **activemq::commands::ConnectionError**:

Public Member Functions

- **ConnectionError** ()
- virtual **~ConnectionError** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ConnectionError * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const
*Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataSet** *value) const
*Compares the **DataSet** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **BrokerError** > & **getException** () const
- virtual **Pointer**< **BrokerError** > & **getException** ()
- virtual void **setException** (const **Pointer**< **BrokerError** > &exception)
- virtual const **Pointer**< **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_CONNECTIONERROR** = 16

Protected Attributes

- **Pointer**< **BrokerError** > exception
- **Pointer**< **ConnectionId** > connectionId

6.224.1 Constructor & Destructor Documentation

6.224.1.1 **activemq::commands::ConnectionError::ConnectionError** ()

6.224.1.2 **virtual activemq::commands::ConnectionError::~~ConnectionError** ()
[virtual]

6.224.2 Member Function Documentation

6.224.2.1 **virtual ConnectionError*** **activemq::commands::ConnectionError::cloneDataSet**
()const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

6.224.2.2 `virtual void activemq::commands::ConnectionError::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

6.224.2.3 `virtual bool activemq::commands::ConnectionError::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

6.224.2.4 `virtual const Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () const [virtual]`

6.224.2.5 `virtual Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () [virtual]`

6.224.2.6 `virtual unsigned char activemq::commands::ConnectionError::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

- 6.224.2.7 **virtual** **Pointer**<**BrokerError**>& **activemq::commands::ConnectionError::getException** ()
[virtual]
- 6.224.2.8 **virtual const** **Pointer**<**BrokerError**>& **activemq::commands::ConnectionError::getException** () **const**
[virtual]
- 6.224.2.9 **virtual void** **activemq::commands::ConnectionError::setConnectionId** (**const** **Pointer**< **ConnectionId** > & *connectionId*) [virtual]
- 6.224.2.10 **virtual void** **activemq::commands::ConnectionError::setException** (**const** **Pointer**< **BrokerError** > & *exception*) [virtual]
- 6.224.2.11 **virtual std::string** **activemq::commands::ConnectionError::toString** () **const**
[virtual]

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

- 6.224.2.12 **virtual** **Pointer**<**Command**> **activemq::commands::ConnectionError::visit**
(**activemq::state::CommandVisitor** * *visitor*) **throw** (**exceptions::ActiveMQException**) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

6.224.3 Field Documentation

6.224.3.1 **Pointer<ConnectionId> activemq::commands::ConnectionError::connectionId**
[protected]

6.224.3.2 **Pointer<BrokerError> activemq::commands::ConnectionError::exception**
[protected]

6.224.3.3 **const unsigned char activemq::commands::ConnectionError::ID_-
CONNECTIONERROR = 16** [static]

() [inline, virtual]

6.225.3 Member Function Documentation

6.225.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.225.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.225.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

6.225.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

6.225

activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller

Class Reference

1339

```
6.225.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

```
6.225.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

```
6.225.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

6.226.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

6.226

activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller

Class Reference

1343

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

```
6.226.3.5  virtual int activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightMarshal1  
            ( OpenWireFormat * wireFormat, commands::DataStructure *  
              dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )  
            [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 775).

```
6.226.3.6  virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightMarshal2  
            ( OpenWireFormat * wireFormat, commands::DataStructure  
              * dataStructure, decaf::io::DataOutputStream * dataOut,  
              utils::BooleanStream * bs ) throw ( decaf::io::IOException )  
            [virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 776).

```
6.226.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 782).

```
6.227.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 783).

```
6.227.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 784).

The documentation for this class was generated from the following file:

6.228

activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller

 () [inline, virtual]

6.228.3 Member Function Documentation

6.228.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::createObject (**
) const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.228.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.228.3.3 **virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::looseMarshal**
(OpenWireFormat * wireFormat, commands::DataStructure
*** dataStructure, decaf::io::DataOutputStream * dataOut) throw (**
decaf::io::IOException) [virtual]

Write a object instance to data output stream.

6.228

activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller

Class Reference

1351

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

6.228.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

6.228.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 789).

```
6.228.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 790).

```
6.228.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.229

activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller

Class Reference

1353

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ConnectionErrorMarshaller.h**

6.229 **activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller** Class Reference

Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p. 1353).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/ConnectionErrorMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller**:

Public Member Functions

- **ConnectionErrorMarshaller** ()
- virtual **~ConnectionErrorMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.

 () [inline]
- 6.229.2.2 **virtual activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::~~ConnectionErrorMarshaller**
 () [inline, virtual]

6.229.3 Member Function Documentation

- 6.229.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

- 6.229.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::getDataStructureType**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

6.229

activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller

Class Reference

1355

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.229.3.3 virtual void **activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::looseMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

6.229.3.4 virtual void **activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

```

6.229.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

```

6.229.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

6.230

activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller

Class Reference

1357

6.229.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

() [inline, virtual]

6.230.3 Member Function Documentation

6.230.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

6.230

activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller

Class Reference

1359

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.230.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.230.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

6.230.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

```
6.230.3.5  virtual int activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 803).

```
6.230.3.6  virtual void activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 804).

6.230.3.7 `virtual void activemq::wireformat::openwire::marshal::v6::ConnectionErrorMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/ConnectionErrorMarshaller.h`

6.231 cms::ConnectionFactory Class Reference

Defines the interface for a factory that creates connection objects, the **Connection** (p. 1296) objects returned implement the CMS **Connection** (p. 1296) interface and hide the CMS Provider specific implementation details behind that interface.

```
#include <src/main/cms/ConnectionFactory.h>
```

Inheritance diagram for cms::ConnectionFactory:

Public Member Functions

- virtual `~ConnectionFactory()`
- virtual `Connection * createConnection()` throw (`CMSEException`)
Creates a connection with the default user identity.
- virtual `cms::Connection * createConnection` (const std::string &username, const std::string &password)=0 throw (`cms::CMSEException`)
Creates a connection with the default specified identity.
- virtual `cms::Connection * createConnection` (const std::string &username, const std::string &password, const std::string &clientId)=0 throw (`cms::CMSEException`)
Creates a connection with the specified user identity.

Static Public Member Functions

- static `ConnectionFactory * createCMSConnectionFactory` (const std::string &brokerURI) throw (`cms::CMSEException`)
Static method that is used to create a provider specific connection factory.

6.231.1 Detailed Description

Defines the interface for a factory that creates connection objects, the **Connection** (p. 1296) objects returned implement the CMS **Connection** (p. 1296) interface and hide the CMS Provider specific implementation details behind that interface. A Client creates a new **ConnectionFactory** (p. 1361) either directly by instantiating the provider specific implementation of the factory or by using the static method `createCMSConnectionFactory` which all providers are required to implement.

Since

1.0

6.231.2 Constructor & Destructor Documentation

- 6.231.2.1 `virtual cms::ConnectionFactory::~~ConnectionFactory()` [inline, virtual]

6.231.3 Member Function Documentation

- 6.231.3.1 `static ConnectionFactory* cms::ConnectionFactory::createCMSConnectionFactory` (const std::string & *brokerURI*) throw (`cms::CMSEException`) [static]

Static method that is used to create a provider specific connection factory.

The provider implements this method in their library and returns an instance of a **ConnectionFactory** (p. 1361) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

Parameters

<i>brokerURI</i>	The remote address to use to connect to the Provider.
------------------	---

Returns

A pointer to a provider specific implementation of the **ConnectionFactory** (p. 1361) interface, the caller is responsible for deleting this resource.

Exceptions

CMSException (p. 1190)	if an internal error occurs while creating the ConnectionFactory (p. 1361).
----------------------------------	--

6.231.3.2 `virtual cms::Connection* cms::ConnectionFactory::createConnection
(const std::string & username, const std::string & password) throw (
cms::CMSException) [pure virtual]`

Creates a connection with the default specified identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 3692) method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless `createConnection` will continue to use the default values that were set in the Constructor.

Parameters

<i>username</i>	The user name used to authenticate with the Provider.
<i>password</i>	The password used to authenticate with the Provider.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSException (p. 1190)	if an internal error occurs while creating the Connection (p. 1296).
----------------------------------	---

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 285).

6.231.3.3 `virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & username, const std::string & password, const std::string & clientId) throw (cms::CMSEException) [pure virtual]`

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 3692) method is explicitly called. The user name and password values passed here do not change the defaults, subsequent calls to the parameterless `createConnection` will continue to use the default values that were set in the Constructor.

Parameters

<i>username</i>	The user name used to authenticate with the Provider.
<i>password</i>	The password used to authenticate with the Provider.
<i>clientId</i>	The Client Id assigned to connection. If the id is the empty string ("") then a random client Id is created for this connection.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSEException (p. 1190)	if an internal error occurs while creating the Connection (p. 1296).
-----------------------------------	---

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 286).

6.231.3.4 `virtual Connection* cms::ConnectionFactory::createConnection () throw (CMSEException) [pure virtual]`

Creates a connection with the default user identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 3692) method is explicitly called.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSEException (p. 1190)	if an internal error occurs while creating the Connection (p. 1296).
-----------------------------------	---

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 285).

The documentation for this class was generated from the following file:

- src/main/cms/ConnectionFactory.h

6.232 activemq::commands::ConnectionId Class Reference

```
#include <src/main/activemq/commands/ConnectionId.h>

Static Public Attributes

- static const unsigned char **ID_CONNECTIONID** = 120

Protected Attributes

- std::string value

6.232.1 Member Typedef Documentation

- 6.232.1.1 **typedef decaf::lang::PointerComparator<ConnectionId>**
activemq::commands::ConnectionId::COMPARATOR

6.232.2 Constructor & Destructor Documentation

- 6.232.2.1 **activemq::commands::ConnectionId::ConnectionId ()**
- 6.232.2.2 **activemq::commands::ConnectionId::ConnectionId (const **ConnectionId** & *other*)**
- 6.232.2.3 **activemq::commands::ConnectionId::ConnectionId (const **SessionId** * *sessionId*)**
- 6.232.2.4 **activemq::commands::ConnectionId::ConnectionId (const **ProducerId** * *producerId*)**
- 6.232.2.5 **activemq::commands::ConnectionId::ConnectionId (const **ConsumerId** * *consumerId*)**
- 6.232.2.6 **virtual activemq::commands::ConnectionId::~~ConnectionId ()** [virtual]

6.232.3 Member Function Documentation

- 6.232.3.1 **virtual **ConnectionId*** activemq::commands::ConnectionId::cloneDataStructure ()**
const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

6.232.3.2 `virtual int activemq::commands::ConnectionId::compareTo (const ConnectionId & value) const` [virtual]

6.232.3.3 `virtual void activemq::commands::ConnectionId::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Implements **activemq::commands::DataStructure** (p. 1715).

6.232.3.4 `virtual bool activemq::commands::ConnectionId::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

6.232.3.5 `virtual bool activemq::commands::ConnectionId::equals (const ConnectionId & value) const` [virtual]

6.232.3.6 `virtual unsigned char activemq::commands::ConnectionId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

- 6.232.3.7 `virtual const std::string& activemq::commands::ConnectionId::getValue () const`
[virtual]
- 6.232.3.8 `virtual std::string& activemq::commands::ConnectionId::getValue ()`
[virtual]
- 6.232.3.9 `virtual bool activemq::commands::ConnectionId::operator< (const ConnectionId
& value) const` [virtual]
- 6.232.3.10 `ConnectionId& activemq::commands::ConnectionId::operator= (const
ConnectionId & other)`
- 6.232.3.11 `virtual bool activemq::commands::ConnectionId::operator== (const ConnectionId
& value) const` [virtual]
- 6.232.3.12 `virtual void activemq::commands::ConnectionId::setValue (const std::string & value
)` [virtual]
- 6.232.3.13 `virtual std::string activemq::commands::ConnectionId::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

6.232.4 Field Documentation

- 6.232.4.1 `const unsigned char activemq::commands::ConnectionId::ID_-
CONNECTIONID = 120` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

- 6.232.4.2 `std::string activemq::commands::ConnectionId::value` [protected]

The documentation for this class was generated from the following file:

6.233 **activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller** Class Reference

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 1368).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ConnectionIdMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller:

Public Member Functions

- **ConnectionIdMarshaller** ()
- virtual **~ConnectionIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**)
throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.233.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 1368). NOTE!
This file is auto generated - do not modify! if you need to make a change, please see
the Java Classes in the activemq-openwire-generator module

6.233.2 Constructor & Destructor Documentation

6.233.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::ConnectionIdMarshaller () [inline]`

6.233.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::~~ConnectionIdMarshaller () [inline, virtual]`

6.233.3 Member Function Documentation

6.233.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.233.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.233.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.233.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.233.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```

6.233.3.6  virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```

6.233.3.7  virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

6.234.3 Member Function Documentation

6.234.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.234.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::getDataStructureType**
() **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.234.3.3 **virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) **throw** (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.234.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.234.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.234.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.234.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

6.235.3 Member Function Documentation

6.235.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.235.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::getDataStructureType**
() **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.235.3.3 **virtual void activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) **throw** (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.235.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.235.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.235.3.6  virtual void activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.235.3.7  virtual void activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.236.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 1381). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.236.2 Constructor & Destructor Documentation

6.236.2.1 **activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::ConnectionIdMarshaller**
() [inline]

6.236.2.2 **virtual activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::~~ConnectionIdMarshaller**
() [inline, virtual]

6.236.3 Member Function Documentation

6.236.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.236.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::getDataStructureType**
() **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.236.3.3 **virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) **throw** (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.236.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.236.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.236.3.6  virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.236.3.7  virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/ConnectionIdMarshaller.h

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.237.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::getDataStructureType**
() **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.237.3.3 **virtual void activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) **throw** (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.237.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.237.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.237.3.6  virtual void activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.237.3.7  virtual void activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.238.3.5 virtual int activemq::wireformat::openwire::marshal::v6::ConnectionIdMarshaller::tightMarshal1 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.238.3.6  virtual void activemq::wireformat::openwire::marshal::v6::ConnectionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.238.3.7  virtual void activemq::wireformat::openwire::marshal::v6::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

6.239.1 Constructor & Destructor Documentation

6.239.1.1 `activemq::commands::ConnectionInfo::ConnectionInfo ()`

6.239.1.2 `virtual activemq::commands::ConnectionInfo::~~ConnectionInfo () [virtual]`

6.239.2 Member Function Documentation

6.239.2.1 `virtual ConnectionInfo* activemq::commands::ConnectionInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.239.2.2 `virtual void activemq::commands::ConnectionInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<code>src</code>	- Source Object
------------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.239.2.3 `Pointer<RemoveInfo> activemq::commands::ConnectionInfo::createRemoveCommand () const`

6.239.2.4 `virtual bool activemq::commands::ConnectionInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

- 6.239.2.5 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath () const [virtual]`
- 6.239.2.6 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath () [virtual]`
- 6.239.2.7 `virtual const std::string& activemq::commands::ConnectionInfo::getClientId () const [virtual]`
- 6.239.2.8 `virtual std::string& activemq::commands::ConnectionInfo::getClientId () [virtual]`
- 6.239.2.9 `virtual Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId () [virtual]`
- 6.239.2.10 `virtual const Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId () const [virtual]`
- 6.239.2.11 `virtual unsigned char activemq::commands::ConnectionInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

6.239.2.12 `virtual const std::string& activemq::commands::ConnectionInfo::getPassword ()`
`const [virtual]`

6.239.2.13 `virtual std::string& activemq::commands::ConnectionInfo::getPassword ()`
`[virtual]`

6.239.2.14 `virtual const std::string& activemq::commands::ConnectionInfo::getUserName ()`
`const [virtual]`

6.239.2.15 `virtual std::string& activemq::commands::ConnectionInfo::getUserName ()`
`[virtual]`

6.239.2.16 `virtual bool activemq::commands::ConnectionInfo::isBrokerMasterConnector ()`
`const [virtual]`

6.239.2.17 `virtual bool activemq::commands::ConnectionInfo::isClientMaster () const`
`[virtual]`

6.239.2.18 `virtual bool activemq::commands::ConnectionInfo::isConnectionInfo () const`
`[inline, virtual]`

Returns

an answer of true to the `isConnectionInfo()` (p. 1397) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 768).

- 6.239.2.19 `virtual bool activemq::commands::ConnectionInfo::isFaultTolerant () const`
[virtual]
- 6.239.2.20 `virtual bool activemq::commands::ConnectionInfo::isManageable () const`
[virtual]
- 6.239.2.21 `virtual void activemq::commands::ConnectionInfo::setBrokerMasterConnector (bool
brokerMasterConnector)` [virtual]
- 6.239.2.22 `virtual void activemq::commands::ConnectionInfo::setBrokerPath (const
std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath)`
[virtual]
- 6.239.2.23 `virtual void activemq::commands::ConnectionInfo::setClientId (const std::string &
clientId)` [virtual]
- 6.239.2.24 `virtual void activemq::commands::ConnectionInfo::setClientMaster (bool
clientMaster)` [virtual]
- 6.239.2.25 `virtual void activemq::commands::ConnectionInfo::setConnectionId (const
Pointer< ConnectionId > & connectionId)` [virtual]
- 6.239.2.26 `virtual void activemq::commands::ConnectionInfo::setFaultTolerant (bool
faultTolerant)` [virtual]
- 6.239.2.27 `virtual void activemq::commands::ConnectionInfo::setManageable (bool
manageable)` [virtual]
- 6.239.2.28 `virtual void activemq::commands::ConnectionInfo::setPassword (const std::string &
password)` [virtual]
- 6.239.2.29 `virtual void activemq::commands::ConnectionInfo::setUserName (const std::string
& userName)` [virtual]
- 6.239.2.30 `virtual std::string activemq::commands::ConnectionInfo::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

6.239.2.31 `virtual Pointer<Command> activemq::commands::ConnectionInfo::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

6.239.3 Field Documentation

6.239.3.1 `bool activemq::commands::ConnectionInfo::brokerMasterConnector
[protected]`

6.239.3.2 `std::vector< decaf::lang::Pointer<BrokerId> >

6.240.2 Constructor & Destructor Documentation

6.240.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::ConnectionInfoMarshaller
() [inline]`

6.240.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::~~ConnectionInfoMarshaller
() [inline, virtual]`

6.240.3 Member Function Documentation

6.240.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::createObject (
) const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.240.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::getDataStructureType
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.240.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

6.240.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

6.240.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

6.240.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightMarshal2
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

6.240.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream
* *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i> if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ConnectionInfoMarshaller.h`

6.241 **activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 1404).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/ConnectionInfoMarshaller.h>
```

- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.241.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 1404).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.241.2 Constructor & Destructor Documentation

6.241.2.1 **activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::ConnectionInfoMarshaller**
() [inline]

6.241.2.2 **virtual activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::~~ConnectionInfoMarshaller**
() [inline, virtual]

6.241.3 Member Function Documentation

6.241.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::createObject** (
) const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.241.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.241.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 772).

6.241.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 774).

6.241.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

6.241.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

```
6.241.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

() [inline, virtual]

6.242.3 Member Function Documentation

6.242.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.242.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.242.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

6.242.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

6.242.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

6.242.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

6.242.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

6.243.3 Member Function Documentation

6.243.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.243.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.243.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

6.243.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

6.243.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 789).

```
6.243.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 790).

```
6.243.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/ConnectionInfoMarshaller.h

6.244 activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 1417).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/ConnectionInfoMarshaller
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller:

Public Member Functions

6.244.2.1 **activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::ConnectionInfoMarshaller**
 () [inline]

6.244.2.2 **virtual activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::~~ConnectionInfoMarshaller**
 () [inline, virtual]

6.244.3 Member Function Documentation

6.244.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::createObject** () **const** [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.244.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::getDataStructureType**
 () **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.244.3.3 **virtual void activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::looseMarshal**
 (**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) **throw** (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

6.244.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

6.244.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

```
6.244.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

```
6.244.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.245 activemq::wireformat::openwire::marshal::v6::ConnectionInfoMarshaller

Class Reference

1421

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

Gets an Vector of the CMSX property names.

6.246.1 Detailed Description

A **ConnectionMetaData** (p. 1425) object provides information describing the **Connection** (p. 1296) object.

Since

1.3

6.246.2 Constructor & Destructor Documentation

- 6.246.2.1 virtual cms::ConnectionMetaData::~~ConnectionMetaData () [inline, virtual]

6.246.3 Member Function Documentation

- 6.246.3.1 virtual int cms::ConnectionMetaData::getCMSMajorVersion () const throw (cms::CMSEException) [pure virtual]

Gets the CMS major version number.

Returns

the CMS API major version number

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 294).

6.246.3.2 `virtual int cms::ConnectionMetaData::getCMSMinorVersion () const throw (cms::CMSException) [pure virtual]`

Gets the CMS minor version number.

Returns

the CMS API minor version number

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 294).

6.246.3.3 `virtual std::string cms::ConnectionMetaData::getCMSProviderName () const throw (cms::CMSException) [pure virtual]`

Gets the CMS provider name.

Returns

the CMS provider name

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 295).

6.246.3.4 `virtual std::string cms::ConnectionMetaData::getCMSVersion () const throw (cms::CMSException) [pure virtual]`

Gets the CMS API version.

Returns

the CMS API Version in String form.

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 295).

6.246.3.5 `virtual std::vector<std::string> cms::ConnectionMetaData::getCMSXPropertyNames () const throw (cms::CMSException) [pure virtual]`

Gets an Vector of the CMSX property names.

Returns

an Vector of CMSX property names

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 295).

6.246.3.6 `virtual int cms::ConnectionMetaData::getProviderMajorVersion () const throw (cms::CMSException) [pure virtual]`

Gets the CMS provider major version number.

Returns

the CMS provider major version number

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 296).

6.246.3.7 `virtual int cms::ConnectionMetaData::getProviderMinorVersion () const throw (cms::CMSException) [pure virtual]`

Gets the CMS provider minor version number.

Returns

the CMS provider minor version number

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 296).

6.246.3.8 `virtual std::string cms::ConnectionMetaData::getProviderVersion () const throw (cms::CMSException) [pure virtual]`

Gets the CMS provider version.

Returns

the CMS provider version

Exceptions

<i>CMSException</i> (p. 1190)	If the CMS Provider fails to retrieve the metadata due to some internal error.
---	--

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 296).

6.249 decaf::util::logging::ConsoleHandler Class Reference

This **Handler** (p. 2042) publishes log records to System.err.

```
#include <src/main/decaf/util/logging/ConsoleHandler.h>
```

Inheritance diagram for decaf::util::logging::ConsoleHandler:

Public Member Functions

- **ConsoleHandler** ()
- virtual **~ConsoleHandler** ()
- virtual void **close** () throw (decaf::io::IOException)
Close the current output stream.
- virtual void **publish** (const **LogRecord** &record)
*Publish the Log Record to this **Handler** (p. 2042).*

6.249.1 Detailed Description

This **Handler** (p. 2042) publishes log records to System.err. By default the **SimpleFormatter** (p. 3604) is used to generate brief summaries.

Configuration: By default each **ConsoleHandler** (p. 1439) is initialized using the following **LogManager** (p. 2480) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

ConsoleHandler.level specifies the default level for the **Handler** (p. 2042) (defaults to **Level.INFO** (p. 2408)). ConsoleHandler.filter specifies the name of a **Filter** (p. 1949) class to use (defaults to no **Filter** (p. 1949)). ConsoleHandler.formatter specifies the name of a **Formatter** (p. 2027) class to use (defaults to **SimpleFormatter** (p. 3604)).

Since

1.0

6.249.2.1 decaf::util::logging::ConsoleHandler::ConsoleHandler ()

6.249.2.2 virtual decaf::util::logging::ConsoleHandler::~~ConsoleHandler () [inline, virtual]

6.249.3 Member Function Documentation

6.249.3.1 virtual void decaf::util::logging::ConsoleHandler::close () throw (decaf::io::IOException) [virtual]

Close the current output stream.

Override the **StreamHandler** (p. 3756) close to flush the Std Err stream but doesn't close.

Exceptions

<i>IOException</i>	
--------------------	--

Reimplemented from **decaf::util::logging::StreamHandler** (p. 3758).

6.249.3.2 virtual void **decaf::util::logging::ConsoleHandler::publish** (const **LogRecord** & *record*) [virtual]

Publish the Log Record to this **Handler** (p. 2042).

Parameters

<i>record</i>	The LogRecord (p. 2487) to Publish
---------------	---

Reimplemented from **decaf::util::logging::StreamHandler** (p. 3759).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**ConsoleHandler.h**

6.250 activemq::commands::ConsumerControl Class Reference

```
#include <src/main/activemq/commands/ConsumerControl.h>
```

Inheritance diagram for **activemq::commands::ConsumerControl**:

Public Member Functions

- **ConsumerControl** ()
- virtual **~ConsumerControl** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ConsumerControl** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*

6.250.1 Constructor & Destructor Documentation

6.250.1.1 `activemq::commands::ConsumerControl::ConsumerControl ()`

6.250.1.2 `virtual activemq::commands::ConsumerControl::~~ConsumerControl ()`
[virtual]

6.250.2 Member Function Documentation

6.250.2.1 `virtual ConsumerControl* activemq::commands::ConsumerControl::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.250.2.2 `virtual void activemq::commands::ConsumerControl::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.250.2.3 `virtual bool activemq::commands::ConsumerControl::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.250.2.4 **virtual const Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId () const**
[virtual]

6.250.2.5 **virtual Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId ()**
[virtual]

6.250.2.6 **virtual unsigned char activemq::commands::ConsumerControl::getDataStructureType () const** [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

- 6.250.2.7 **virtual const Pointer<ActiveMQDestination>&**
activemq::commands::ConsumerControl::getDestination () const [virtual]
- 6.250.2.8 **virtual Pointer<ActiveMQDestination>&**
activemq::commands::ConsumerControl::getDestination () [virtual]
- 6.250.2.9 **virtual int activemq::commands::ConsumerControl::getPrefetch () const**
[virtual]
- 6.250.2.10 **virtual bool activemq::commands::ConsumerControl::isClose () const**
[virtual]
- 6.250.2.11 **virtual bool activemq::commands::ConsumerControl::isFlush () const**
[virtual]
- 6.250.2.12 **virtual bool activemq::commands::ConsumerControl::isStart () const**
[virtual]
- 6.250.2.13 **virtual bool activemq::commands::ConsumerControl::isStop () const**
[virtual]
- 6.250.2.14 **virtual void activemq::commands::ConsumerControl::setClose (bool *close*)**
[virtual]
- 6.250.2.15 **virtual void activemq::commands::ConsumerControl::setConsumerId (const**
Pointer< ConsumerId > & *consumerId*) [virtual]
- 6.250.2.16 **virtual void activemq::commands::ConsumerControl::setDestination (const**
Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.250.2.17 **virtual void activemq::commands::ConsumerControl::setFlush (bool *flush*)**
[virtual]
- 6.250.2.18 **virtual void activemq::commands::ConsumerControl::setPrefetch (int *prefetch*)**
[virtual]
- 6.250.2.19 **virtual void activemq::commands::ConsumerControl::setStart (bool *start*)**
[virtual]
- 6.250.2.20 **virtual void activemq::commands::ConsumerControl::setStop (bool *stop*)**
[virtual]
- 6.250.2.21 **virtual std::string activemq::commands::ConsumerControl::toString () const**
[virtual]

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 770).

6.250.2.22 `virtual Pointer<Command> activemq::commands::ConsumerControl::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 1232).

() [inline, virtual]

6.251.3 Member Function Documentation

6.251.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.251.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.251.3.3 **virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

6.251

activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller

Class Reference

1449

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

6.251.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

6.251.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 810).

```
6.251.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 811).

```
6.251.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.252

activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller

Class Reference

1451

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**ConsumerControlMarshaller.h**

6.252 **activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller** Class Reference

() [inline]

6.252.2.2 **virtual activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::~~ConsumerControlMarshaller**
() [inline, virtual]

6.252.3 Member Function Documentation

6.252.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.252.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

6.252

activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller

Class Reference

1453

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.252.3.3 virtual void **activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::looseMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

6.252.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

```

6.252.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

```

6.252.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

6.253

activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller

Class Reference

1455

6.252.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**ConsumerControlMarshaller.h**

6.253 **activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller** Class Reference

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p. 1455).

6.253.3 Member Function Documentation

6.253.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

6.253

activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller

Class Reference

1457

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.253.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.253.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

6.253.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```
6.253.3.5  virtual int activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

```
6.253.3.6  virtual void activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

6.254

activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller

Class Reference

1459

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

6.253.3.7 virtual void **activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

Class Reference

1469

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.256.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p. 1468).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.256.2 Constructor & Destructor Documentation

6.256.2.1 **activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::ConsumerControlMarshaller**
() [inline]

6.256.2.2 **virtual activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::~~ConsumerControlMarshaller**
() [inline, virtual]

6.256.3 Member Function Documentation

6.256.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.256.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

```
6.256.3.3  virtual void activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 801).

```
6.256.3.4  virtual void activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 802).

6.256

activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller

Class Reference

1471

```
6.256.3.5 virtual int activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 803).

```
6.256.3.6 virtual void activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 804).

```
6.256.3.7 virtual void activemq::wireformat::openwire::marshal::v6::ConsumerControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/ConsumerControlMarshaller.h

6.257 activemq::commands::ConsumerId Class Reference

6.257.1 Member Typedef Documentation

6.257.1.1 `typedef decaf::lang::PointerComparator<ConsumerId>`
`activemq::commands::ConsumerId::COMPARATOR`

6.257.2 Constructor & Destructor Documentation

6.257.2.1 `activemq::commands::ConsumerId::ConsumerId ()`

6.257.2.2 `activemq::commands::ConsumerId::ConsumerId (const ConsumerId & other)`

6.257.2.3 `activemq::commands::ConsumerId::ConsumerId (const SessionId & sessionId,
long long consumerId)`

6.257.2.4 `virtual activemq::commands::ConsumerId::~~ConsumerId ()` [virtual]

6.257.3 Member Function Documentation

6.257.3.1 `virtual ConsumerId* activemq::commands::ConsumerId::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.257.3.2 `virtual int activemq::commands::ConsumerId::compareTo (const ConsumerId &
value) const` [virtual]

6.257.3.3 `virtual void activemq::commands::ConsumerId::copyDataStructure (const
DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Implements `activemq::commands::DataStructure` (p. 1715).

6.257.3.4 `virtual bool activemq::commands::ConsumerId::equals (const DataStructure *
value) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

6.257.3.5 `virtual bool activemq::commands::ConsumerId::equals (const ConsumerId &
value) const` [virtual]

6.257.3.6 `virtual std::string& activemq::commands::ConsumerId::getConnectionId ()`
[virtual]

6.257.3.7 `virtual const std::string& activemq::commands::ConsumerId::getConnectionId ()`
const [virtual]

6.257.3.8 `virtual unsigned char activemq::commands::ConsumerId::getDataStructureType ()`
const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

- 6.257.3.9 `const Pointer<SessionId>& activemq::commands::ConsumerId::getParentId () const`
- 6.257.3.10 `virtual long long activemq::commands::ConsumerId::getSessionId () const [virtual]`
- 6.257.3.11 `virtual long long activemq::commands::ConsumerId::getValue () const [virtual]`
- 6.257.3.12 `virtual bool activemq::commands::ConsumerId::operator< (const ConsumerId & value) const [virtual]`
- 6.257.3.13 `ConsumerId& activemq::commands::ConsumerId::operator= (const ConsumerId & other)`
- 6.257.3.14 `virtual bool activemq::commands::ConsumerId::operator== (const ConsumerId & value) const [virtual]`
- 6.257.3.15 `virtual void activemq::commands::ConsumerId::setConnectionId (const std::string & connectionId) [virtual]`
- 6.257.3.16 `virtual void activemq::commands::ConsumerId::setSessionId (long long sessionId) [virtual]`
- 6.257.3.17 `virtual void activemq::commands::ConsumerId::setValue (long long value) [virtual]`
- 6.257.3.18 `virtual std::string activemq::commands::ConsumerId::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

6.257.4 Field Documentation

- 6.257.4.1 `std::string activemq::commands::ConsumerId::connectionId [protected]`
- 6.257.4.2 `const unsigned char activemq::commands::ConsumerId::ID_-CONSUMERID = 122 [static]`

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.258 activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller

Write a object instance to data output stream.

6.258.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 1477). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.258.2 Constructor & Destructor Documentation

6.258.2.1 **activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::ConsumerIdMarshaller**
 () [inline]

6.258.2.2 **virtual activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::~~ConsumerIdMarshaller**
 () [inline, virtual]

6.258.3 Member Function Documentation

6.258.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::createObject** ()
 const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.258.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::getDataStructureType**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.258.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.258.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.258.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.258.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.258.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.

6.259 activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller

Class Reference

1481

<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

6.259.3 Member Function Documentation

6.259.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.259.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::getDataStructureType**
() **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.259.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.259.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.259.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
`[virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1690).

6.259.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
`[virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1698).

6.260 activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller

Class Reference

1485

6.259.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.260.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 1485). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.260.2 Constructor & Destructor Documentation

6.260.2.1 **activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::ConsumerIdMarshaller**
() [inline]

6.260.2.2 **virtual activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::~~ConsumerIdMarshaller**
() [inline, virtual]

6.260.3 Member Function Documentation

6.260.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.260.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.260.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.260.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.260.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.260.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.261 activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller

Class Reference

1489

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.260.3.7 virtual void **activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**ConsumerIdMarshaller.h**

6.261 activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller

Class Reference

() [inline]

6.261.2.2 **virtual activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::~~ConsumerIdMarshaller**
() [inline, virtual]

6.261.3 Member Function Documentation

6.261.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.261.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.261.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.261.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

```
6.261.3.5  virtual int activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.261.3.6  virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.262 activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller

Class Reference

1493

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.261.3.7 virtual void **activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.262.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.262.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.262.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.263 activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller

Class Reference

1497

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.262.3.7 virtual void **activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

6.263.3 Member Function Documentation

- 6.263.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.263.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.263.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.263.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

```
6.263.3.5  virtual int activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.263.3.6  virtual void activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.263.3.7 virtual void activemq::wireformat::openwire::marshal::v6::ConsumerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
  * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

6.264.1 Constructor & Destructor Documentation

6.264.1.1 `activemq::commands::ConsumerInfo::ConsumerInfo ()`

6.264.1.2 `virtual activemq::commands::ConsumerInfo::~~ConsumerInfo () [virtual]`

6.264.2 Member Function Documentation

6.264.2.1 `virtual ConsumerInfo* activemq::commands::ConsumerInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.264.2.2 `virtual void activemq::commands::ConsumerInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.264.2.3 `Pointer<RemoveInfo> activemq::commands::ConsumerInfo::createRemoveCommand () const`

6.264.2.4 `virtual bool activemq::commands::ConsumerInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

- 6.264.2.5 `virtual const Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () const` [virtual]
- 6.264.2.6 `virtual Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate ()` [virtual]
- 6.264.2.7 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath () const` [virtual]
- 6.264.2.8 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath ()` [virtual]
- 6.264.2.9 `virtual Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId ()` [virtual]
- 6.264.2.10 `virtual const Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId () const` [virtual]
- 6.264.2.11 `virtual unsigned char activemq::commands::ConsumerInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1713) type copy.

Implements **activemq::commands::DataSet** (p. 1717).

- 6.264.2.12 `virtual const Pointer<ActiveMQDestination>&
activemq::commands::ConsumerInfo::getDestination () const [virtual]`
- 6.264.2.13 `virtual Pointer<ActiveMQDestination>&
activemq::commands::ConsumerInfo::getDestination () [virtual]`
- 6.264.2.14 `virtual int activemq::commands::ConsumerInfo::getMaximumPendingMessageLimit () const [virtual]`
- 6.264.2.15 `virtual const std::vector< decaf::lang::Pointer<ConsumerId> >&
activemq::commands::ConsumerInfo::getNetworkConsumerPath () const [virtual]`
- 6.264.2.16 `virtual std::vector< decaf::lang::Pointer<ConsumerId> >&
activemq::commands::ConsumerInfo::getNetworkConsumerPath () [virtual]`
- 6.264.2.17 `virtual int activemq::commands::ConsumerInfo::getPrefetchSize () const [virtual]`
- 6.264.2.18 `virtual unsigned char activemq::commands::ConsumerInfo::getPriority () const [virtual]`
- 6.264.2.19 `virtual const std::string& activemq::commands::ConsumerInfo::getSelector () const [virtual]`
- 6.264.2.20 `virtual std::string& activemq::commands::ConsumerInfo::getSelector () [virtual]`
- 6.264.2.21 `virtual const std::string& activemq::commands::ConsumerInfo::getSubscriptionName () const [virtual]`
- 6.264.2.22 `virtual std::string& activemq::commands::ConsumerInfo::getSubscriptionName () [virtual]`
- 6.264.2.23 `virtual bool activemq::commands::ConsumerInfo::isBrowser () const [virtual]`
- 6.264.2.24 `virtual bool activemq::commands::ConsumerInfo::isConsumerInfo () const [inline, virtual]`

Returns

an answer of true to the `isConsumerInfo()` (p. 1506) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 768).

- 6.264.2.25 `virtual bool activemq::commands::ConsumerInfo::isDispatchAsync () const`
[virtual]
- 6.264.2.26 `virtual bool activemq::commands::ConsumerInfo::isExclusive () const`
[virtual]
- 6.264.2.27 `virtual bool activemq::commands::ConsumerInfo::isNetworkSubscription () const`
[virtual]
- 6.264.2.28 `virtual bool activemq::commands::ConsumerInfo::isNoLocal () const`
[virtual]
- 6.264.2.29 `virtual bool activemq::commands::ConsumerInfo::isNoRangeAcks () const`
[virtual]
- 6.264.2.30 `virtual bool activemq::commands::ConsumerInfo::isOptimizedAcknowledge () const` [virtual]
- 6.264.2.31 `virtual bool activemq::commands::ConsumerInfo::isRetroactive () const`
[virtual]
- 6.264.2.32 `virtual void activemq::commands::ConsumerInfo::setAdditionalPredicate (const Pointer< BooleanExpression > & additionalPredicate)` [virtual]
- 6.264.2.33 `virtual void activemq::commands::ConsumerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath)`
[virtual]
- 6.264.2.34 `virtual void activemq::commands::ConsumerInfo::setBrowser (bool browser)`
[virtual]
- 6.264.2.35 `virtual void activemq::commands::ConsumerInfo::setConsumerId (const Pointer< ConsumerId > & consumerId)` [virtual]
- 6.264.2.36 `virtual void activemq::commands::ConsumerInfo::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.264.2.37 `virtual void activemq::commands::ConsumerInfo::setDispatchAsync (bool dispatchAsync)` [virtual]
- 6.264.2.38 `virtual void activemq::commands::ConsumerInfo::setExclusive (bool exclusive)`
[virtual]
- 6.264.2.39 `virtual void activemq::commands::ConsumerInfo::setMaximumPendingMessageLimit (int maximumPendingMessageLimit)` [virtual]
- 6.264.2.40 `virtual void activemq::commands::ConsumerInfo::setNetworkConsumerPath (const std::vector< decaf::lang::Pointer< ConsumerId > > & networkConsumerPath)` [virtual]
- 6.264.2.41 `virtual void activemq::commands::ConsumerInfo::setNetworkSubscription (bool networkSubscription)` [virtual]
Generated on Sat Mar 26 2011 07:19:23 for activemq-cpp-3.2.5 by Doxygen
- 6.264.2.42 `virtual void activemq::commands::ConsumerInfo::setNoLocal (bool noLocal)`
[virtual]
- 6.264.2.43 `virtual void activemq::commands::ConsumerInfo::setNoRangeAcks (bool noRangeAcks)` [virtual]

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

6.264.2.51 `virtual Pointer<Command> activemq::commands::ConsumerInfo::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.265.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1510). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.265.2 Constructor & Destructor Documentation

6.265.2.1 `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::ConsumerInfoMarshaller () [inline]`

6.265.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller () [inline, virtual]`

6.265.3 Member Function Documentation

6.265.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.265.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.265.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

6.265.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

6.265.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

6.265.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal2
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

6.265.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream
* *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i> if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**ConsumerInfoMarshaller.h**

6.266 **activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1514).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/ConsumerInfoMar
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller**:

Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.266.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1514). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.266.2 Constructor & Destructor Documentation

6.266.2.1 **activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::ConsumerInfoMarshaller**
() [inline]

6.266.2.2 **virtual activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller**
() [inline, virtual]

6.266.3 Member Function Documentation

6.266.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.266.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.266.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 772).

6.266.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 774).

6.266.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal1
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
 [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**
 (p. 775).

6.266.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal2
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException)
 [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**
 (p. 776).

```
6.266.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.267.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1518). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.267.2 Constructor & Destructor Documentation

6.267.2.1 **activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::ConsumerInfoMarshaller**
() [inline]

6.267.2.2 **virtual activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller**
() [inline, virtual]

6.267.3 Member Function Documentation

6.267.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.267.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.267.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

6.267.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

6.267.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

6.267.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

```
6.267.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/ConsumerInfoMarshaller.h

6.268 activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1522).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/ConsumerInfoMar
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller**:

Public Member Functions

- **ConsumerInfoMarshaller ()**

6.268.3 Member Function Documentation

6.268.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.268.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.268.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

6.268.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

6.268.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 789).

```
6.268.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 790).

```
6.268.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 792).

The documentation for this class was generated from the following file:

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

```
6.269.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

```
6.269.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.270 activemq::wireformat::openwire::marshal::v6::ConsumerInfoMarshaller

Class Reference

1531

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.

6.270 activemq::wireformat::openwire::marshal::v6::ConsumerInfoMarshaller

Class Reference 1533

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

```
6.270.3.3 virtual void activemq::wireformat::openwire::marshal::v6::ConsumerInfoMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

```
6.270.3.4 virtual void activemq::wireformat::openwire::marshal::v6::ConsumerInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

```
6.270.3.5  virtual int activemq::wireformat::openwire::marshal::v6::ConsumerInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.270.3.6  virtual void activemq::wireformat::openwire::marshal::v6::ConsumerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

6.270.3.7 virtual void activemq::wireformat::openwire::marshal::v6::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

```

Inheritance diagram for `activemq::commands::ControlCommand`:

Public Member Functions

- **ControlCommand** ()
- virtual **~ControlCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaller share.
- virtual **ControlCommand** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const

Compares the *DataSet* (p. 1713) passed in to this one, and returns if they are equivalent.

- virtual const std::string & **getCommand** () const
- virtual std::string & **getCommand** ()
- virtual void **setCommand** (const std::string &command)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_CONTROLCOMMAND** = 14

Protected Attributes

- std::string **command**

6.272.1 Constructor & Destructor Documentation

6.272.1.1 **activemq::commands::ControlCommand::ControlCommand** ()

6.272.1.2 **virtual activemq::commands::ControlCommand::~~ControlCommand** ()
[virtual]

6.272.2 Member Function Documentation

6.272.2.1 **virtual ControlCommand*** **activemq::commands::ControlCommand::cloneDataSet**
() const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataSet** (p. 1714).

6.272.2.2 **virtual void** **activemq::commands::ControlCommand::copyDataSet** (const
DataSet * src) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

6.272.2.3 `virtual bool activemq::commands::ControlCommand::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

6.272.2.4 `virtual std::string& activemq::commands::ControlCommand::getCommand ()` [virtual]

6.272.2.5 `virtual const std::string& activemq::commands::ControlCommand::getCommand () const` [virtual]

6.272.2.6 `virtual unsigned char activemq::commands::ControlCommand::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

6.272.2.7 `virtual void activemq::commands::ControlCommand::setCommand (const std::string & command)` [virtual]

6.272.2.8 `virtual std::string activemq::commands::ControlCommand::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

6.273

activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller

Class Reference

1539

6.272.2.9 **virtual** **Pointer**<**Command**> **activemq::commands::ControlCommand::visit**
(**activemq::state::CommandVisitor** * *visitor*) **throw** (
exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

6.272.3 Field Documentation

6.272.3.1 **std::string** **activemq::commands::ControlCommand::command**
[protected]

6.272.3.2 **const unsigned char** **activemq::commands::ControlCommand::ID_**-
CONTROLCOMMAND = 14 [static]

() [inline, virtual]

6.273.3 Member Function Documentation

6.273.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.273.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.273.3.3 **virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

6.273.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

6.273.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.273

activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller

Class Reference

1543

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

6.273.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

6.273.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

```
6.275.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

6.276.3 Member Function Documentation

6.276.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.276.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.276.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

6.276.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

6.276

activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller

Class Reference

1555

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

```
6.276.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```
6.276.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

6.276.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/ControlCommandMarshaller.h`

6.277 **activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller** Class Reference

Marshaling code for Open Wire Format for **ControlCommandMarshaller** (p. 1556).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/ControlCommandMarshaller.h>
```

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

6.277.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

```
6.277.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

```
6.277.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 799).

Write a object instance to data output stream.

6.278

activemq::wireformat::openwire::marshal::v6::ControlCommandMarshaller

Class Reference

1563

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

6.278.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

6.278.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.278.3.6 virtual void activemq::wireformat::openwire::marshal::v6::ControlCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

```
6.278.3.7 virtual void activemq::wireformat::openwire::marshal::v6::ControlCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

The documentation for this class was generated from the following file:

6.279 decaf::util::concurrent::CountDownLatch Class Reference

```
#include <src/main/decaf/util/concurrent/CountDownLatch.h>
```

Public Member Functions

- **CountDownLatch** (int count)

Constructor.

- virtual **~CountDownLatch** ()
- virtual void **await** () throw (decaf::lang::exceptions::InterruptedException, decaf::lang::Exception)

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted.

- virtual bool **await** (long long timeout) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::Exception)

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

- virtual bool **await** (long long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::Exception)

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

- virtual void **countDown** ()

Counts down the latch, releasing all waiting threads when the count hits zero.

- virtual int **getCount** () const

Gets the current count.

6.279.1 Constructor & Destructor Documentation

6.279.1.1 `decaf::util::concurrent::CountDownLatch::CountDownLatch (int count)`

Constructor.

Parameters

<i>count</i>	- number to count down from.
--------------	------------------------------

6.279.1.2 `virtual decaf::util::concurrent::CountDownLatch::~~CountDownLatch ()` [virtual]

6.279.2 Member Function Documentation

6.279.2.1 `virtual void decaf::util::concurrent::CountDownLatch::await () throw (decaf::lang::exceptions::InterruptedException, decaf::lang::Exception)` [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted.

If the current count is zero then this method returns immediately.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happen:

- * The count reaches zero due to invocations of the **countDown()** (p. 1568) method; or
- * Some other thread interrupts the current thread.

If the current thread:

- * has its interrupted status set on entry to this method; or
 - * is interrupted while waiting,
- then `InterruptedException` is thrown and the current thread's interrupted status is cleared.

Exceptions

<i>InterruptedException</i>	- if the current thread is interrupted while waiting.
<i>Exception</i>	- if any other error occurs.

6.279.2.2 `virtual bool decaf::util::concurrent::CountDownLatch::await (long long timeOut) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::Exception)` [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

If the current count is zero then this method returns immediately with the value true.

If the current count is greater than zero then the current thread becomes disabled for

thread scheduling purposes and lies dormant until one of three things happen:

* The count reaches zero due to invocations of the **countDown()** (p. 1568) method;
or * Some other thread interrupts the current thread; or * The specified waiting time elapses.

If the count reaches zero then the method returns with the value true.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting,
then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

<i>timeout</i>	- Time in milliseconds to wait for the count to reach zero.
----------------	---

Exceptions

<i>InterruptedException</i>	- if the current thread is interrupted while waiting.
<i>Exception</i>	- if any other error occurs.

6.279.2.3 `virtual bool decaf::util::concurrent::CountDownLatch::await (long long timeout, const TimeUnit & unit) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::Exception)` [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

If the current count is zero then this method returns immediately with the value true.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happen:

* The count reaches zero due to invocations of the **countDown()** (p. 1568) method;
or * Some other thread interrupts the current thread; or * The specified waiting time elapses.

If the count reaches zero then the method returns with the value true.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting,
then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

<i>timeout</i>	- Time to wait for the count to reach zero.
<i>unit</i>	- The units that the timeout specifies.

Exceptions

<i>InterruptedException</i>	- if the current thread is interrupted while waiting.
<i>Exception</i>	- if any other error occurs.

6.279.2.4 `virtual void decaf::util::concurrent::CountDownLatch::countDown ()`
`[virtual]`

Counts down the latch, releasing all waiting threads when the count hits zero.

6.279.2.5 `virtual int decaf::util::concurrent::CountDownLatch::getCount () const`
`[inline, virtual]`

Gets the current count.

Returns

int count value

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/CountDownLatch.h`

6.280 decaf::util::zip::CRC32 Class Reference

Class that can be used to compute a CRC-32 checksum for a data stream.

```
#include <src/main/decaf/util/zip/CRC32.h>
```

Inheritance diagram for `decaf::util::zip::CRC32`:

Public Member Functions

- **CRC32** ()
- virtual **~CRC32** ()
- virtual long long **getValue** () const
- virtual void **reset** ()
Reset the checksum to its initial value.
- virtual void **update** (const std::vector< unsigned char > &buffer)
Updates the current checksum with the specified vector of bytes.
- virtual void **update** (const std::vector< unsigned char > &buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Updates the current checksum with the specified array of bytes.

- virtual void **update** (const unsigned char *buffer, int size, int offset, int length)
throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Updates the current checksum with the specified array of bytes.

- virtual void **update** (int byte)

Updates the current checksum with the specified byte value.

6.280.1 Detailed Description

Class that can be used to compute a CRC-32 checksum for a data stream.

Since

1.0

6.280.2 Constructor & Destructor Documentation

6.280.2.1 decaf::util::zip::CRC32::CRC32 ()

6.280.2.2 virtual decaf::util::zip::CRC32::~~CRC32 () [virtual]

6.280.3 Member Function Documentation

6.280.3.1 virtual long long decaf::util::zip::CRC32::getValue () const [virtual]

Returns

the current checksum value.

Implements **decaf::util::zip::Checksum** (p. 1175).

6.280.3.2 virtual void decaf::util::zip::CRC32::reset () [virtual]

Reset the checksum to its initial value.

Implements **decaf::util::zip::Checksum** (p. 1175).

6.280.3.3 virtual void decaf::util::zip::CRC32::update (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>size</i>	The size of the passed buffer.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>NullPointerException</i>	if the passed buffer is NULL.
<i>IndexOutOfBoundsException</i>	if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 1175).

6.280.3.4 `virtual void decaf::util::zip::CRC32::update (const std::vector< unsigned char > & buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if offset + length > size of the buffer.
----------------------------------	--

Implements **decaf::util::zip::Checksum** (p. 1176).

6.280.3.5 `virtual void decaf::util::zip::CRC32::update (const std::vector< unsigned char > & buffer) [virtual]`

Updates the current checksum with the specified vector of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
---------------	--

Implements **decaf::util::zip::Checksum** (p. 1176).

6.280.3.6 `virtual void decaf::util::zip::CRC32::update (int byte) [virtual]`

Updates the current checksum with the specified byte value.

Parameters

<i>byte</i>	The byte value to update the current Checksum (p. 1174) with (0..255).
-------------	---

Implements **decaf::util::zip::Checksum** (p. 1176).

The documentation for this class was generated from the following file:

6.282 activemq::commands::DataArrayResponse Class Reference

```
#include <src/main/activemq/commands/DataArrayResponse.h>
```

Inheritance diagram for activemq::commands::DataArrayResponse:

Public Member Functions

- **DataArrayResponse** ()
- virtual **~DataArrayResponse** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DataArrayResponse * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual const std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** () const
- virtual std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** ()
- virtual void **setData** (const std::vector< **decaf::lang::Pointer**< **DataStructure** > > &data)

Static Public Attributes

- static const unsigned char **ID_DATAARRAYRESPONSE** = 33

Protected Attributes

- std::vector< **decaf::lang::Pointer**< **DataStructure** > > **data**

6.282.1 Constructor & Destructor Documentation

6.282.1.1 `activemq::commands::DataArrayResponse::DataArrayResponse ()`

6.282.1.2 `virtual activemq::commands::DataArrayResponse::~~DataArrayResponse ()`
[virtual]

6.282.2 Member Function Documentation

6.282.2.1 `virtual DataArrayResponse* activemq::commands::DataArrayResponse::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::Response` (p. 3380).

6.282.2.2 `virtual void activemq::commands::DataArrayResponse::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<code>src</code>	- Source Object
------------------	-----------------

Reimplemented from `activemq::commands::Response` (p. 3380).

6.282.2.3 `virtual bool activemq::commands::DataArrayResponse::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::Response` (p. 3381).

- 6.282.2.4 `virtual std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () [virtual]`
- 6.282.2.5 `virtual const std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () const [virtual]`
- 6.282.2.6 `virtual unsigned char activemq::commands::DataArrayResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Reimplemented from **activemq::commands::Response** (p. 3381).

- 6.282.2.7 `virtual void activemq::commands::DataArrayResponse::setData (const std::vector< decaf::lang::Pointer< DataStructure > > & data) [virtual]`
- 6.282.2.8 `virtual std::string activemq::commands::DataArrayResponse::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 3382).

6.282.3 Field Documentation

- 6.282.3.1 `std::vector< decaf::lang::Pointer<DataStructure> > activemq::commands::DataArrayResponse::data [protected]`
- 6.282.3.2 `const unsigned char activemq::commands::DataArrayResponse::ID_ - DATAARRAYRESPONSE = 33 [static]`

The documentation for this class was generated from the following file:

6.283.2 Constructor & Destructor Documentation

6.283.2.1 `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::DataArrayResponseMarshaller () [inline]`

6.283.2.2 `virtual activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::~~DataArrayResponseMarshaller () [inline, virtual]`

6.283.3 Member Function Documentation

6.283.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3395).

6.283.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3395).

6.283.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

6.283

activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller
Class Reference **1577**
Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3395).

6.283.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3396).

6.283.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3397).

```
6.283.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3397).

```
6.283.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3398).

The documentation for this class was generated from the following file:

6.284.3 Member Function Documentation

6.284.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::createObject**
 () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller**
 (p. 3405).

6.284.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::getDataStructureType**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller**
 (p. 3405).

6.284

activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller

Class Reference

1581

6.284.3.3 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3405).

6.284.3.4 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3406).

6.284.3.5 virtual int activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3407).

```
6.284.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3407).

```
6.284.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

6.285

activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller
Class Reference **1583**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3408).

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3391).

```
6.285.3.5  virtual int activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3392).

```
6.285.3.6  virtual void activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

6.286

activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller
Class Reference **1587**
Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3392).

6.285.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.

- virtual void `looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- virtual void `looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`
Write a object instance to data output stream.

6.286.1 Detailed Description

Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 1587).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.286

activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller

Class Reference

1589

6.286.2 Constructor & Destructor Documentation

6.286.2.1 `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::DataArrayResponseMarshaller
() [inline]`

6.286.2.2 `virtual activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::~~DataArrayResponseMarshaller
() [inline, virtual]`

6.286.3 Member Function Documentation

6.286.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller`
(p. 3410).

6.286.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::getDataStructureType
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller`
(p. 3410).

6.286.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3410).

6.286.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3411).

6.286.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.286

activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller

Class Reference

1591

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3412).

6.286.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3412).

6.286.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3413).

The documentation for this class was generated from the following file:

6.287.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller**
(p. 3400).

6.287.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller**
(p. 3400).

6.287.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3400).

6.287.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3401).

6.287.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

6.287

activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller**Class Reference****1595****Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3402).

```
6.287.3.6 virtual void activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3402).

```
6.287.3.7 virtual void activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3403).

[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3417).

6.288.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3417).

```
6.288.3.7 virtual void activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
  * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3418).

```
#include <src/main/decaf/util/zip/DataFormatException.h>
```

Inheritance diagram for decaf::util::zip::DataFormatException:

Public Member Functions

- **DataFormatException** () throw ()
Default Constructor.
- **DataFormatException** (const lang::Exception &ex) throw ()
Copy Constructor.

- **DataFormatException** (const **DataFormatException** &ex) throw ()
Copy Constructor.
- **DataFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **DataFormatException** (const std::exception *cause) throw ()
Constructor.
- **DataFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **DataFormatException** * clone () const
Clones this exception.
- virtual ~**DataFormatException** () throw ()

6.289.1 Constructor & Destructor Documentation

6.289.1.1 decaf::util::zip::DataFormatException::DataFormatException () throw ()
[inline]

Default Constructor.

6.289.1.2 decaf::util::zip::DataFormatException::DataFormatException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.289.1.3 decaf::util::zip::DataFormatException::DataFormatException (const DataFormatException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.289.1.4 `decaf::util::zip::DataFormatException::DataFormatException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.
Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.289.1.5 `decaf::util::zip::DataFormatException::DataFormatException (const std::exception * cause) throw ()` `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.289.1.6 `decaf::util::zip::DataFormatException::DataFormatException (const char * file, const int lineNumber, const char * msg, ...) throw ()` `[inline]`

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.289.1.7 `virtual decaf::util::zip::DataFormatException::~~DataFormatException () throw ()` `[inline, virtual]`

6.289.2 Member Function Documentation

6.289.2.1 `virtual DataFormatException* decaf::util::zip::DataFormatException::clone ()` `const` `[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this instance.

Reimplemented from **decaf::lang::Exception** (p. 1889).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**DataFormatException.h**

6.290 decaf::io::DataInput Class Reference

The **DataInput** (p. 1603) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.

```
#include <src/main/decaf/io/DataInput.h>
```

Public Member Functions

- virtual **~DataInput** ()
- virtual bool **readBoolean** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.
- virtual char **readByte** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads and returns one input byte.
- virtual unsigned char **readUnsignedByte** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.
- virtual char **readChar** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads an input char and returns the char value.
- virtual double **readDouble** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads eight input bytes and returns a double value.
- virtual float **readFloat** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads four input bytes and returns a float value.

- virtual int **readInt** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads four input bytes and returns an int value.
- virtual long long **readLong** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads eight input bytes and returns a long value.
- virtual short **readShort** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads two input bytes and returns a short value.
- virtual unsigned short **readUnsignedShort** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads two input bytes and returns an int value in the range 0 through 65535.
- virtual std::string **readString** ()=0 throw (decaf::io::IOException, decaf::io::EOFException)
Reads an NULL terminated ASCII string to the stream and returns the string to the caller.
- virtual std::string **readLine** ()=0 throw (decaf::io::IOException)
Reads the next line of text from the input stream.
- virtual std::string **readUTF** ()=0 throw (decaf::io::IOException, decaf::io::EOFException, decaf::io::UTFDataFormatException)
Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.
- virtual void **readFully** (unsigned char *buffer, int size)=0 throw (decaf::io::IOException, decaf::io::EOFException, decaf::lang::exceptions::IndexOutOfBoundsException)
Reads some bytes from an input stream and stores them into the buffer array buffer.
- virtual void **readFully** (unsigned char *buffer, int size, int offset, int length)=0 throw (decaf::io::IOException, decaf::io::EOFException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Reads length bytes from an input stream.
- virtual long long **skipBytes** (long long num)=0 throw (io::IOException)
Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.290.1 Detailed Description

The **DataInput** (p. 1603) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types. There is also a facility for reconstructing Strings from data in the Java standard modified UTF-8 format.

It is generally true of all the reading routines in this interface that if end of file is reached before the desired number of bytes has been read, an **EOFException** (p. 1881) is thrown. If any byte cannot be read for any reason other than end of file, an **IOException** (p. 2210) other than **EOFException** (p. 1881) is thrown. for example, an **IOException** (p. 2210) may be thrown if the underlying input stream has been closed.

Since

1.0

6.290.2 Constructor & Destructor Documentation

6.290.2.1 virtual decaf::io::DataInput::~DataInput () [inline, virtual]

6.290.3 Member Function Documentation

6.290.3.1 virtual bool decaf::io::DataInput::readBoolean () throw (decaf::io::IOException, decaf::io::EOFException) [pure virtual]

Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.

Returns

the boolean value of the read in byte (0=false, 1=true).

Exceptions

IOException (p. 2210)	if an I/O Error occurs.
EOFException (p. 1881)	if the end of input is reached.

6.290.3.2 virtual char decaf::io::DataInput::readByte () throw (decaf::io::IOException, decaf::io::EOFException) [pure virtual]

Reads and returns one input byte.

The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns

the 8-bit value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.3 `virtual char decaf::io::DataInput::readChar () throw (decaf::io::IOException, decaf::io::EOFException) [pure virtual]`

Reads an input char and returns the char value.

A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns

the 8 bit char read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.4 `virtual double decaf::io::DataInput::readDouble () throw (decaf::io::IOException, decaf::io::EOFException) [pure virtual]`

Reads eight input bytes and returns a double value.

It does this by first constructing a long long value in exactly the manner of the `readlong` method, then converting this long value to a double in exactly the manner of the method `Double::longBitsToDouble`.

Returns

the double value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.5 virtual float decaf::io::DataInput::readFloat () throw (decaf::io::IOException, decaf::io::EOFException) [pure virtual]

Reads four input bytes and returns a float value.

It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float::intBitsToFloat.

Returns

the float value read.

Exceptions

IOException (p. 2210)	if an I/O Error occurs.
EOFException (p. 1881)	if the end of input is reached.

6.290.3.6 virtual void decaf::io::DataInput::readFully (unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::io::EOFException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Reads length bytes from an input stream.

This method blocks until one of the following conditions occurs: * length bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1881) is thrown. * An I/O error occurs, in which case an **IOException** (p. 2210) other than **EOFException** (p. 1881) is thrown.

If buffer is NULL, a NullPointerException is thrown. If offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If length is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[offset], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to length.

Parameters

<i>buffer</i>	The byte array to insert read data into.
<i>size</i>	The size in bytes of the given byte buffer.
<i>offset</i>	The location in buffer to start writing.
<i>length</i>	The number of bytes to read from the buffer.

Exceptions

IOException (p. 2210)	if an I/O Error occurs.
EOFException (p. 1881)	if the end of input is reached.

<i>NullPointerException</i>	if the buffer is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length > size, or an int param is negative.

6.290.3.7 `virtual void decaf::io::DataInput::readFully (unsigned char * buffer, int size) throw (decaf::io::IOException, decaf::io::EOFException, decaf::lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Reads some bytes from an input stream and stores them into the buffer array *buffer*.

The number of bytes read is equal to the length of *buffer*.

This method blocks until one of the following conditions occurs: * *buffer*'s size bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1881) is thrown. * An I/O error occurs, in which case an **IOException** (p. 2210) other than **EOFException** (p. 1881) is thrown.

If *buffer* size is zero, then no bytes are read. Otherwise, the first byte read is stored into element *b*[0], the next one into *b*[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of *buffer* have been updated with data from the input stream.

Parameters

<i>buffer</i>	The byte array to insert read data into.
<i>size</i>	The size in bytes of the given byte buffer.

Exceptions

IOException (p. 2210)	if an I/O Error occurs.
EOFException (p. 1881)	if the end of input is reached.
<i>IndexOutOfBoundsException</i>	if the size value is negative.

6.290.3.8 `virtual int decaf::io::DataInput::readInt () throw (decaf::io::IOException, decaf::io::EOFException)` [pure virtual]

Reads four input bytes and returns an int value.

Let *a* be the first byte read, *b* be the second byte, *c* be the third byte, and *d* be the fourth byte. The value returned is:

$((a \& 0xff) << 24) \mid ((b \& 0xff) << 16) \mid ((c \& 0xff) << 8) \mid (d \& 0xff)$

Returns

the int value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.9 `virtual std::string decaf::io::DataInput::readLine () throw (decaf::io::IOException) [pure virtual]`

Reads the next line of text from the input stream.

It reads successive bytes, converting each byte to an ASCII char separately, until it encounters a line terminator or end of file; the characters read are then returned as a standard String. Note that because this method processes bytes, it does not support input of the full Unicode character set.

If end of file is encountered before even one byte can be read, then an empty string is returned. Otherwise, each byte that is read is converted to type char. If the character ' ' is encountered, it is discarded and reading ceases. If the character " " is encountered, it is discarded and, if the following byte converts to the character ' ' , then that is discarded also; reading then ceases. If end of file is encountered before either of the characters ' ' and " " is encountered, reading ceases. Once reading has ceased, a String is returned that contains all the characters read and not discarded, taken in order.

Returns

the next line of text read from the input stream or empty string if at EOF.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
--	-------------------------

6.290.3.10 `virtual long long decaf::io::DataInput::readLong () throw (decaf::io::IOException, decaf::io::EOFException) [pure virtual]`

Reads eight input bytes and returns a long value.

Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be the sixth byte, g be the seventh byte, and h be the eighth byte. The value returned is:

```
((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) |
((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) |
((long)(g & 0xff) << 8) | ((long)(h & 0xff))
```

Returns

the 64 bit long long read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.11 `virtual short decaf::io::DataInput::readShort () throw (decaf::io::IOException, decaf::io::EOFException)` [pure virtual]

Reads two input bytes and returns a short value.

Let a be the first byte read and b be the second byte. The value returned is:

```
(short)((a << 8) | (b & 0xff))
```

Returns

the 16 bit short value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.12 `virtual std::string decaf::io::DataInput::readString () throw (decaf::io::IOException, decaf::io::EOFException)` [pure virtual]

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

Returns

string object containing the string read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
--	-------------------------

<i>EOFException</i> (p. 1881)	if the end of input is reached.
---	---------------------------------

6.290.3.13 `virtual unsigned char decaf::io::DataInput::readUnsignedByte () throw
(decaf::io::IOException, decaf::io::EOFException) [pure
virtual]`

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns

the 8 bit unsigned value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.14 `virtual unsigned short decaf::io::DataInput::readUnsignedShort () throw
(decaf::io::IOException, decaf::io::EOFException) [pure
virtual]`

Reads two input bytes and returns an int value in the range 0 through 65535.

Let a be the first byte read and b be the second byte. The value returned is:

$((a \& 0xff) \ll 8) | (b \& 0xff)$

Returns

the 16 bit unsigned short read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.290.3.15 `virtual std::string decaf::io::DataInput::readUTF () throw
(decaf::io::IOException, decaf::io::EOFException,
decaf::io::UTFDataFormatException) [pure virtual]`

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.

This method reads String value written from a Java **DataOutputStream** (p. 1628) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns

The decoded string read from stream.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.
<i>UTFDataFormatException</i> (p. 4078)	if the bytes are not valid modified UTF-8 values.

6.290.3.16 `virtual long long decaf::io::DataInput::skipBytes (long long num) throw (
io::IOException) [pure virtual]`

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 1881). The actual number of bytes skipped is returned.

Parameters

<i>num</i>	The number of bytes to skip over.
------------	-----------------------------------

Returns

the total number of bytes skipped.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
--	-------------------------

The documentation for this class was generated from the following file:

- `src/main/decaf/io/DataInput.h`

6.291 decaf::io::DataInputStream Class Reference

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

```
#include <src/main/decaf/io/DataInputStream.h>
```

Inheritance diagram for decaf::io::DataInputStream:

Public Member Functions

- **DataInputStream** (**InputStream** *inputStream, bool own=false)
*Creates a **DataInputStream** (p. 1612) that uses the specified underlying **InputStream** (p. 2105).*
- virtual ~**DataInputStream** ()
- virtual bool **readBoolean** () throw (decaf::io::IOException, decaf::io::EOFException)
Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.
- virtual char **readByte** () throw (decaf::io::IOException, decaf::io::EOFException)
Reads and returns one input byte.
- virtual unsigned char **readUnsignedByte** () throw (decaf::io::IOException, decaf::io::EOFException)
Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.
- virtual char **readChar** () throw (decaf::io::IOException, decaf::io::EOFException)
Reads an input char and returns the char value.
- virtual double **readDouble** () throw (decaf::io::IOException, decaf::io::EOFException)
Reads eight input bytes and returns a double value.
- virtual float **readFloat** () throw (decaf::io::IOException, decaf::io::EOFException)
Reads four input bytes and returns a float value.
- virtual int **readInt** () throw (decaf::io::IOException, decaf::io::EOFException)

Reads four input bytes and returns an int value.

- virtual long long **readLong** () throw (decaf::io::IOException, decaf::io::EOFException)

Reads eight input bytes and returns a long value.

- virtual short **readShort** () throw (decaf::io::IOException, decaf::io::EOFException)

Reads two input bytes and returns a short value.

- virtual unsigned short **readUnsignedShort** () throw (decaf::io::IOException, decaf::io::EOFException)

Reads two input bytes and returns an int value in the range 0 through 65535.

- virtual std::string **readString** () throw (decaf::io::IOException, decaf::io::EOFException)

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

- virtual std::string **readLine** () throw (decaf::io::IOException)

Reads the next line of text from the input stream.

- virtual std::string **readUTF** () throw (decaf::io::IOException, decaf::io::EOFException, decaf::io::UTFDataFormatException)

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.

- virtual void **readFully** (unsigned char *buffer, int size) throw (decaf::io::IOException, decaf::io::EOFException, decaf::lang::exceptions::IndexOutOfBoundsException)

Reads some bytes from an input stream and stores them into the buffer array buffer.

- virtual void **readFully** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::io::EOFException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Reads length bytes from an input stream.

- virtual long long **skipBytes** (long long num) throw (io::IOException)

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.291.1 Detailed Description

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way. An application uses a data output stream to write data that can later be read by a data input stream.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped **InputStream** (p. 2105) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

```
DataInputStream (p. 1612) os = new DataInputStream (p. 1612)( new InputStream()
(p. 2107), true )
```

Since

1.0

6.291.2 Constructor & Destructor Documentation

6.291.2.1 `decaf::io::DataInputStream::DataInputStream (InputStream * inputStream, bool own = false)`

Creates a **DataInputStream** (p. 1612) that uses the specified underlying **InputStream** (p. 2105).

Parameters

<i>inputStream</i>	the InputStream (p. 2105) instance to wrap.
<i>own</i>	indicates if this class owns the wrapped string defaults to false.

6.291.2.2 `virtual decaf::io::DataInputStream::~~DataInputStream () [virtual]`

6.291.3 Member Function Documentation

6.291.3.1 `virtual bool decaf::io::DataInputStream::readBoolean () throw (decaf::io::IOException, decaf::io::EOFException) [virtual]`

Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.

Returns

the boolean value of the read in byte (0=false, 1=true).

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.2 `virtual char decaf::io::DataInputStream::readByte () throw (decaf::io::IOException, decaf::io::EOFException)` [virtual]

Reads and returns one input byte.

The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns

the 8-bit value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.3 `virtual char decaf::io::DataInputStream::readChar () throw (decaf::io::IOException, decaf::io::EOFException)` [virtual]

Reads an input char and returns the char value.

A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns

the 8 bit char read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.4 `virtual double decaf::io::DataInputStream::readDouble () throw (decaf::io::IOException, decaf::io::EOFException)` [virtual]

Reads eight input bytes and returns a double value.

It does this by first constructing a long long value in exactly the manner of the `readlong` method, then converting this long value to a double in exactly the manner of the method `Double::longBitsToDouble`.

Returns

the double value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.5 virtual float decaf::io::DataInputStream::readFloat () throw (decaf::io::IOException, decaf::io::EOFException) [virtual]

Reads four input bytes and returns a float value.

It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float::intBitsToFloat.

Returns

the float value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.6 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::io::EOFException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Reads length bytes from an input stream.

This method blocks until one of the following conditions occurs: * length bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1881) is thrown. * An I/O error occurs, in which case an **IOException** (p. 2210) other than **EOFException** (p. 1881) is thrown.

If buffer is NULL, a NullPointerException is thrown. If offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If length is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[offset], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to length.

Parameters

<i>buffer</i>	The byte array to insert read data into.
<i>size</i>	The size in bytes of the given byte buffer.
<i>offset</i>	The location in buffer to start writing.
<i>length</i>	The number of bytes to read from the buffer.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.
<i>NullPointerException</i>	if the buffer is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length > size.

6.291.3.7 `virtual void decaf::io::DataInputStream::readFully (unsigned char * buffer,
int size) throw (decaf::io::IOException, decaf::io::EOFException,
decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Reads some bytes from an input stream and stores them into the buffer array *buffer*.

The number of bytes read is equal to the length of *buffer*.

This method blocks until one of the following conditions occurs: * *buffer*'s size bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1881) is thrown. * An I/O error occurs, in which case an **IOException** (p. 2210) other than **EOFException** (p. 1881) is thrown.

If *buffer* size is zero, then no bytes are read. Otherwise, the first byte read is stored into element *b*[0], the next one into *b*[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of *buffer* have been updated with data from the input stream.

Parameters

<i>buffer</i>	The byte array to insert read data into.
<i>size</i>	The size in bytes of the given byte buffer.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.
<i>IndexOutOfBoundsException</i>	if the size value is negative.

6.291.3.8 `virtual int decaf::io::DataInputStream::readInt () throw (decaf::io::IOException,
decaf::io::EOFException)` [virtual]

Reads four input bytes and returns an int value.

Let *a* be the first byte read, *b* be the second byte, *c* be the third byte, and *d* be the fourth byte. The value returned is:

$((a \& 0xff) << 24) | ((b \& 0xff) << 16) | ((c \& 0xff) << 8) | (d \& 0xff)$

Returns

the int value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.9 `virtual std::string decaf::io::DataInputStream::readLine () throw (decaf::io::IOException) [virtual]`

Reads the next line of text from the input stream.

It reads successive bytes, converting each byte to an ASCII char separately, until it encounters a line terminator or end of file; the characters read are then returned as a standard String. Note that because this method processes bytes, it does not support input of the full Unicode character set.

If end of file is encountered before even one byte can be read, then an empty string is returned. Otherwise, each byte that is read is converted to type char. If the character ' is encountered, it is discarded and reading ceases. If the character " is encountered, it is discarded and, if the following byte converts to the character ' , then that is discarded also; reading then ceases. If end of file is encountered before either of the characters ' and " is encountered, reading ceases. Once reading has ceased, a String is returned that contains all the characters read and not discarded, taken in order.

Returns

the next line of text read from the input stream or empty string if at EOF.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
--	-------------------------

6.291.3.10 `virtual long long decaf::io::DataInputStream::readLong () throw (decaf::io::IOException, decaf::io::EOFException) [virtual]`

Reads eight input bytes and returns a long value.

Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be the sixth byte, g be the seventh byte, and h be the eighth

byte. The value returned is:

```
((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) |
((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) |
((long)(g & 0xff) << 8) | ((long)(h & 0xff)))
```

Returns

the 64 bit long long read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.11 `virtual short decaf::io::DataInputStream::readShort () throw (decaf::io::IOException, decaf::io::EOFException)` [virtual]

Reads two input bytes and returns a short value.

Let a be the first byte read and b be the second byte. The value returned is:

```
(short)((a << 8) | (b & 0xff))
```

Returns

the 16 bit short value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.12 `virtual std::string decaf::io::DataInputStream::readString () throw (decaf::io::IOException, decaf::io::EOFException)` [virtual]

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

Returns

string object containing the string read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
--	-------------------------

<i>EOFException</i> (p. 1881)	if the end of input is reached.
---	---------------------------------

6.291.3.13 virtual unsigned char decaf::io::DataInputStream::readUnsignedByte () throw (decaf::io::IOException, decaf::io::EOFException) [virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns

the 8 bit unsigned value read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.14 virtual unsigned short decaf::io::DataInputStream::readUnsignedShort () throw (decaf::io::IOException, decaf::io::EOFException) [virtual]

Reads two input bytes and returns an int value in the range 0 through 65535.

Let a be the first byte read and b be the second byte. The value returned is:

$((a \& 0xff) \ll 8) | (b \& 0xff)$

Returns

the 16 bit unsigned short read.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.

6.291.3.15 virtual std::string decaf::io::DataInputStream::readUTF () throw (decaf::io::IOException, decaf::io::EOFException, decaf::io::UTFDataFormatException) [virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained

all ASCII values (0-255), if so this method will throw a `UTFFormatException`.

This method reads String value written from a Java **DataOutputStream** (p. 1628) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns

The decoded string read from stream.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
<i>EOFException</i> (p. 1881)	if the end of input is reached.
<i>UTFDataFormatException</i> (p. 4078)	if the bytes are not valid modified UTF-8 values.

6.291.3.16 `virtual long long decaf::io::DataInputStream::skipBytes (long long num) throw (io::IOException) [virtual]`

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 1881). The actual number of bytes skipped is returned.

Parameters

<i>num</i>	The number of bytes to skip over.
------------	-----------------------------------

Returns

the total number of bytes skipped.

Exceptions

<i>IOException</i> (p. 2210)	if an I/O Error occurs.
--	-------------------------

The documentation for this class was generated from the following file:

- `src/main/decaf/io/DataInputStream.h`

6.292 decaf::io::DataOutput Class Reference

The **DataOutput** (p. 1622) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.

```
#include <src/main/decaf/io/DataOutput.h>
```

Public Member Functions

- virtual **~DataOutput** ()
- virtual void **writeBoolean** (bool value)=0 throw (decaf::io::IOException)
Writes a boolean to the underlying output stream as a 1-byte value.
- virtual void **writeByte** (unsigned char value)=0 throw (decaf::io::IOException)
Writes out a byte to the underlying output stream as a 1-byte value.
- virtual void **writeShort** (short value)=0 throw (decaf::io::IOException)
Writes a short to the underlying output stream as two bytes, high byte first.
- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (decaf::io::IOException)
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual void **writeChar** (char value)=0 throw (decaf::io::IOException)
Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.
- virtual void **writeInt** (int value)=0 throw (decaf::io::IOException)
Writes an int to the underlying output stream as four bytes, high byte first.
- virtual void **writeLong** (long long value)=0 throw (decaf::io::IOException)
Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.
- virtual void **writeFloat** (float value)=0 throw (decaf::io::IOException)
Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.
- virtual void **writeDouble** (double value)=0 throw (decaf::io::IOException)
Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.
- virtual void **writeBytes** (const std::string &value)=0 throw (decaf::io::IOException)
Writes out the string to the underlying output stream as a sequence of bytes.

- virtual void **writeChars** (const std::string &value)=0 throw (decaf::io::IOException)

Writes a string to the underlying output stream as a sequence of characters.

- virtual void **writeUTF** (const std::string &value)=0 throw (decaf::io::IOException, decaf::io::UTFDataFormatException)

Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes.

6.292.1 Detailed Description

The **DataOutput** (p. 1622) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream. There is also a facility for converting Strings into the Java standard modified UTF-8 format and writing the resulting series of bytes.

If a method in this interface encounters an error while writing it will throw an **IOException** (p. 2210).

DataOutputStream (p. 1628)

Since

1.0

6.292.2 Constructor & Destructor Documentation

6.292.2.1 virtual decaf::io::DataOutput::~DataOutput () [inline, virtual]

6.292.3 Member Function Documentation

6.292.3.1 virtual void decaf::io::DataOutput::writeBoolean (bool *value*) throw (decaf::io::IOException) [pure virtual]

Writes a boolean to the underlying output stream as a 1-byte value.

The value true is written out as the value (byte)1; the value false is written out as the value (byte)0. If no exception is thrown, the counter written is incremented by 1.

Parameters

<i>value</i>	The boolean to write as a byte (1=true, 0=false).
--------------	---

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.2 virtual void decaf::io::DataOutput::writeByte (unsigned char *value*) throw (decaf::io::IOException) [pure virtual]

Writes out a byte to the underlying output stream as a 1-byte value.

If no exception is thrown, the counter written is incremented by 1.

Parameters

<i>value</i>	The unsigned char value to write.
--------------	-----------------------------------

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.3 virtual void decaf::io::DataOutput::writeBytes (const std::string & *value*) throw (decaf::io::IOException) [pure virtual]

Writes out the string to the underlying output stream as a sequence of bytes.

Each character in the string is written out, in sequence, by discarding its high eight bits. If no exception is thrown, the counter written is incremented by the length of value. The value written does not include a trailing null as that is not part of the sequence of bytes, if the null is needed, then use the writeChars method.

Parameters

<i>value</i>	The vector of bytes to write.
--------------	-------------------------------

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.4 virtual void decaf::io::DataOutput::writeChar (char *value*) throw (decaf::io::IOException) [pure virtual]

Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.

Parameters

<i>value</i>	The signed char value to write.
--------------	---------------------------------

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.5 `virtual void decaf::io::DataOutput::writeChars (const std::string & value) throw (decaf::io::IOException)` [pure virtual]

Writes a string to the underlying output stream as a sequence of characters.

Each character is written to the data output stream as if by the writeChar method. If no exception is thrown, the counter written is incremented by the length of value. The trailing NULL character is written by this method.

Parameters

<i>value</i>	The string value to write as raw bytes.
--------------	---

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.6 `virtual void decaf::io::DataOutput::writeDouble (double value) throw (decaf::io::IOException)` [pure virtual]

Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.

If no exception is thrown, the counter written is incremented by 8.

Parameters

<i>value</i>	The 64bit double value to write.
--------------	----------------------------------

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.7 `virtual void decaf::io::DataOutput::writeFloat (float value) throw (decaf::io::IOException)` [pure virtual]

Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.

If no exception is thrown, the counter written is incremented by 4.

Parameters

<i>value</i>	The 32bit floating point value to write.
--------------	--

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.8 `virtual void decaf::io::DataOutput::writeInt (int value) throw (decaf::io::IOException) [pure virtual]`

Writes an int to the underlying output stream as four bytes, high byte first.

If no exception is thrown, the counter written is incremented by 4.

Parameters

<i>value</i>	The signed integer value to write.
--------------	------------------------------------

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.9 `virtual void decaf::io::DataOutput::writeLong (long long value) throw (decaf::io::IOException) [pure virtual]`

Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.

If no exception is thrown, the counter written is incremented by 8.

Parameters

<i>value</i>	The signed 64bit long value to write.
--------------	---------------------------------------

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.10 `virtual void decaf::io::DataOutput::writeShort (short value) throw (decaf::io::IOException) [pure virtual]`

Writes a short to the underlying output stream as two bytes, high byte first.

If no exception is thrown, the counter written is incremented by 2.

Parameters

<i>value</i>	The signed short value to write.
--------------	----------------------------------

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.11 `virtual void decaf::io::DataOutput::writeUnsignedShort (unsigned short value)
throw (decaf::io::IOException)` [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

<i>value</i>	The unsigned short to write to the stream.
--------------	--

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
--	---------------------------------

6.292.3.12 `virtual void decaf::io::DataOutput::writeUTF (const std::string & value) throw (
decaf::io::IOException, decaf::io::UTFDataFormatException)`
[pure virtual]

Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes.

The first two bytes written are indicate its encoded length followed by the rest of the string's characters encoded as modified UTF-8. The length represent the encoded length of the data not the actual length of the string.

Parameters

<i>value</i>	The string value value to write as modified UTF-8.
--------------	--

Exceptions

<i>IOException</i> (p. 2210)	if an I/O error is encountered.
<i>UTFDataFormatException</i> (p. 4078)	if the encoded size if greater than 65535

- src/main/decaf/io/**DataOutput.h**

6.293 decaf::io::DataOutputStream Class Reference

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

```
#include <src/main/decaf/io/DataOutputStream.h>
```

Inheritance diagram for decaf::io::DataOutputStream:

Public Member Functions

- **DataOutputStream** (**OutputStream** *outputStream, bool own=false)
Creates a new data output stream to write data to the specified underlying output stream.
- virtual ~**DataOutputStream** ()
- virtual long long **size** () const
Returns the current value of the counter written, the number of bytes written to this data output stream so far.
- virtual void **writeBoolean** (bool value) throw (**IOException**)
- virtual void **writeByte** (unsigned char value) throw (**IOException**)
- virtual void **writeShort** (short value) throw (**IOException**)
- virtual void **writeUnsignedShort** (unsigned short value) throw (**IOException**)
- virtual void **writeChar** (char value) throw (**IOException**)
- virtual void **writeInt** (int value) throw (**IOException**)
- virtual void **writeLong** (long long value) throw (**IOException**)
- virtual void **writeFloat** (float value) throw (**IOException**)

- virtual void **writeDouble** (double value) throw (IOException)
- virtual void **writeBytes** (const std::string &value) throw (IOException)
- virtual void **writeChars** (const std::string &value) throw (IOException)
- virtual void **writeUTF** (const std::string &value) throw (IOException, UTF-DataFormatException)

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value) throw (decaf::io::IOException)
- virtual void **doWriteArrayBounded** (const unsigned char ***buffer**, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Protected Attributes

- long long **written**
- unsigned char **buffer** [8]

6.293.1 Detailed Description

A data output stream lets an application write primitive Java data types to an output stream in a portable way. An application can then use a data input stream to read the data back in.

6.293.2 Constructor & Destructor Documentation

6.293.2.1 `decaf::io::DataOutputStream::DataOutputStream (OutputStream * outputStream, bool own = false)`

Creates a new data output stream to write data to the specified underlying output stream.

Parameters

<i>output-Stream</i>	a stream to wrap with this one.
<i>own</i>	true if this objects owns the stream that it wraps.

6.293.2.2 virtual decaf::io::DataOutputStream::~~DataOutputStream () [virtual]

6.293.3 Member Function Documentation

6.293.3.1 virtual void decaf::io::DataOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1960).

6.293.3.2 virtual void decaf::io::DataOutputStream::doWriteByte (unsigned char *value*) throw (decaf::io::IOException) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1960).

6.293.3.3 virtual long long decaf::io::DataOutputStream::size () const [inline, virtual]

Returns the current value of the counter written, the number of bytes written to this data output stream so far.

If the counter overflows, it will be wrapped to **decaf::lang::Long::MAX_VALUE** (p. 2510).

Returns

the value of the written field.

- 6.293.3.4 `virtual void decaf::io::DataOutputStream::writeBoolean (bool value) throw (IOException) [virtual]`
- 6.293.3.5 `virtual void decaf::io::DataOutputStream::writeByte (unsigned char value) throw (IOException) [virtual]`

6.294.1 Constructor & Destructor Documentation

6.294.1.1 `activemq::commands::DataResponse::DataResponse ()`

6.294.1.2 `virtual activemq::commands::DataResponse::~~DataResponse () [virtual]`

6.294.2 Member Function Documentation

6.294.2.1 `virtual DataResponse* activemq::commands::DataResponse::cloneDataStructure (
) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::Response` (p. 3380).

6.294.2.2 `virtual void activemq::commands::DataResponse::copyDataStructure (const
 DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::Response` (p. 3380).

6.294.2.3 `virtual bool activemq::commands::DataResponse::equals (const DataStructure *
 value) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p. 3381).

6.294.2.4 **virtual** **Pointer**<**DataSet**Structure>& **activemq::commands::DataResponse::getData** () [virtual]

6.294.2.5 **virtual const** **Pointer**<**DataSet**Structure>& **activemq::commands::DataResponse::getData** () **const** [virtual]

6.294.2.6 **virtual unsigned char** **activemq::commands::DataResponse::getDataStructureType** () **const** [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet**Structure (p. 1713) type copy.

Reimplemented from **activemq::commands::Response** (p. 3381).

6.294.2.7 **virtual void** **activemq::commands::DataResponse::setData** (**const** **Pointer**<**DataSet**Structure > & *data*) [virtual]

6.294.2.8 **virtual std::string** **activemq::commands::DataResponse::toString** () **const** [virtual]

Returns a string containing the information for this **DataSet**Structure (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 3382).

6.294.3 Field Documentation

6.294.3.1 **Pointer**<**DataSet**Structure> **activemq::commands::DataResponse::data** [protected]

6.294.3.2 **const unsigned char** **activemq::commands::DataResponse::ID_ - DATARESPONSE = 32** [static]

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.295.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1635). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.295.2 Constructor & Destructor Documentation

6.295.2.1 `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::DataResponseMarshaller () [inline]`

6.295.2.2 `virtual activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::~~DataResponseMarshaller () [inline, virtual]`

6.295.3 Member Function Documentation

6.295.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3400).

6.295.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3400).

6.295.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3400).

6.295.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3401).

6.295.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3402).

6.295.3.6 virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
 [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3402).

6.295.3.7 virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i> if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3403).

The documentation for this class was generated from the following file:

() [inline]

6.296.2.2 **virtual activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::~~DataResponseMarshaller**
() [inline, virtual]

6.296.3 Member Function Documentation

6.296.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3415).

6.296.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3415).

6.296.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3415).

6.296.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3416).

6.296 activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller

Class Reference 1643

6.296.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3417).

6.296.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3417).

```
6.296.3.7 virtual void activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3418).

The documentation for this class was generated from the following file:

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3410).

6.300.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3410).

6.300.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3410).

6.300.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3411).

6.300.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3412).

6.300.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

6.301 activemq::wireformat::openwire::marshal::DataStreamMarshaller Class Reference 1661

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3412).

6.300.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3413).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**DataResponseMarshaller.h**

6.301 activemq::wireformat::openwire::marshal::DataStreamMarshaller Class Reference

Base class for all classes that marshal commands for Openwire.

```
#include <src/main/activemq/wireformat/openwire/marshal/DataStreamMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::DataStreamMarshaller**:

Public Member Functions

- virtual **~DataStreamMarshaller** ()

- virtual unsigned char **getDataStructureType** () const =0
Gets the DataStructureType that this class marshals/unmarshals.
- virtual **commands::DataStructure * createObject** () const =0
Creates a new instance of the class that this class is a marshaling director for.
- virtual int **tightMarshal1** (**OpenWireFormat** *format, **commands::DataStructure** *command, **utils::BooleanStream** *bs)=0 throw (**decaf::io::IOException**)
Tight Marshal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs)=0 throw (**decaf::io::IOException**)
Tight Marshal to the given stream.
- virtual void **tightUnmarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataInputStream** *dis, **utils::BooleanStream** *bs)=0 throw (**decaf::io::IOException**)
Tight Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataOutputStream** *ds)=0 throw (**decaf::io::IOException**)
Tight Marshal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataInputStream** *dis)=0 throw (**decaf::io::IOException**)
Loose Un-marhsal to the given stream.

6.301.1 Detailed Description

Base class for all classes that marshal commands for Openwire.

6.301.2 Constructor & Destructor Documentation

- 6.301.2.1 virtual **activemq::wireformat::openwire::marshal::DataStreamMarshaller::~DataStreamMarshaller** () [inline, virtual]

6.301.3 Member Function Documentation

- 6.301.3.1 virtual **commands::DataStructure* activemq::wireformat::openwire::marshal::DataStreamMarshaller::createObject** () const [pure virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 195), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 240), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 370), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 398), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 446), `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 492), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 558), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 616), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 651), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 681), `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 711), `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 887), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 920), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 1316), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 1350), `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 1382), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1414), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1461), `activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller` (p. 1490), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1524), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1553), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1589), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1657), `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1798), `activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller` (p. 1832), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1920), `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 2020), `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2181), `activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller` (p. 2249), `activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller` (p. 2278), `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller` (p. 2301), `activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller` (p. 2332), `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller` (p. 2361), `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2396), `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 2447), `activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller` (p. 2667), `activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller` (p. 2709), `activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller` (p. 2739), `activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller` (p. 2776), `activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller` (p. 2847), `activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller` (p. 2902), `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 3029), `activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller` (p. 3151), `activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller` (p. 3182), `activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller` (p. 3200), `activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller` (p. 3302),

`activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller` (p. 3319), `activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller` (p. 3352), `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3410), `activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller` (p. 3502), `activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller` (p. 3518), `activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller` (p. 3586), `activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller` (p. 3792), `activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller` (p. 3969), `activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller` (p. 4122), `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 4161), `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 203), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 257), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 383), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 411), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 459), `activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller` (p. 505), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 571), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller` (p. 629), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller` (p. 659), `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 694), `activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller` (p. 724), `activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller` (p. 899), `activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller` (p. 933), `activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller` (p. 1329), `activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller` (p. 1337), `activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller` (p. 1370), `activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller` (p. 1401), `activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller` (p. 1448), `activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller` (p. 1478), `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller` (p. 1511), `activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller` (p. 1541), `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1576), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1644), `activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller` (p. 1786), `activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller` (p. 1820), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1903), `activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller` (p. 2007), `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2168), `activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller` (p. 2233), `activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller` (p. 2262), `activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller` (p. 2285), `activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller` (p. 2316), `activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller` (p. 2344), `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 2383), `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 2430), `activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller` (p. 2654), `activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller` (p. 2692), `activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller` (p. 2726), `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller` (p. 2756), `activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller` (p. 2830),

6.301.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::DataStreamMarshaller::getDataStructureType
() const [pure virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 195), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 240), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 370), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 398), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 446), `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 492), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 559), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 617), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 651), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 681), `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 711), `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 888), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 920), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 1317), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 1350), `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 1382), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1414), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1461), `activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller` (p. 1491), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1524), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1554), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1589), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1658), `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1799), `activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller` (p. 1833), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1921), `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 2020), `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2181), `activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller` (p. 2249), `activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller` (p. 2278), `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller` (p. 2301), `activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller` (p. 2333), `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller` (p. 2361), `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2397), `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 2447), `activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller` (p. 2667), `activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller` (p. 2709), `activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller` (p. 2739), `activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller` (p. 2777), `activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller` (p. 2847), `activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller` (p. 2902), `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 3029), `activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller` (p. 3151), `activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller` (p. 3183), `activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller` (p. 3200), `activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller` (p. 3302), `activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller` (p. 3320), `activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller` (p. 3353), `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3410), `activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller` (p. 3502), `ac-`

```

6.301.3.3  virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::looseMarshal
( OpenWireFormat * format, commands::DataStructure * command,
  decaf::io::DataOutputStream * ds ) throw ( decaf::io::IOException )
[pure virtual]
  
```

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.

```
6.301.3.4  virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::looseUnmarshal
( OpenWireFormat * format, commands::DataStructure * command,
  decaf::io::DataInputStream * dis ) throw ( decaf::io::IOException )
[pure virtual]
```

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.301.3.5 `virtual int activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal1`
(`OpenWireFormat * format`, `commands::DataStructure * command`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [pure
virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.301.3.6 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal2
 (OpenWireFormat * *format*, commands::DataStructure * *command*,
 decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) throw (
 decaf::io::IOException) [pure virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal

<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 197), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 242), `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 330), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 372), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 400), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 448), `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 494), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 560), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 589), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 618), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 653), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 683), `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 713), `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 790), `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 889), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 922), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 1318), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 1352), `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 1384), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1416), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1463), `activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller` (p. 1492), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1526), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1555), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1591), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1659), `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1800), `activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller` (p. 1834), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1922), `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 2022), `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2183), `activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller` (p. 2251), `activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller` (p. 2280), `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller` (p. 2303), `activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller` (p. 2334), `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller` (p. 2363), `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2398), `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 2449), `activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller` (p. 2669), `activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller` (p. 2711), `activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller` (p. 2741), `activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller` (p. 2778),

6.301.3.7 `virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis, utils::BooleanStream * bs) throw (decaf::io::IOException)` [pure virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/DataStreamMarshaller.h`

6.302 activemq::commands::DataStructure Class Reference

```
#include <src/main/activemq/commands/DataStructure.h>
```

Inheritance diagram for `activemq::commands::DataStructure`:

Public Member Functions

- virtual `~DataStructure ()`
- virtual unsigned char `getDataStructureType ()` const =0
*Get the **DataStructure** (p. 1713) Type as defined in `CommandTypes.h`.*
- virtual `DataStructure * cloneDataStructure ()` const =0
Clone this obbjet and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void `copyDataStructure (const DataStructure *src)`=0
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string `toString ()` const =0
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool `equals (const DataStructure *value)` const =0
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*

6.302.1 Constructor & Destructor Documentation

6.302.1.1 `virtual activemq::commands::DataStructure::~DataStructure () [inline, virtual]`

6.302.2 Member Function Documentation

6.302.2.1 `virtual DataStructure* activemq::commands::DataStructure::cloneDataStructure () const [pure virtual]`

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 186), `activemq::commands::ActiveMQCommand` (p. 219), `activemq::commands::ActiveMQDestination` (p. 315), `activemq::commands::ActiveMQMapMessage` (p. 354), `activemq::commands::ActiveMQMessage` (p. 391), `activemq::commands::ActiveMQObjectMessage` (p. 439), `activemq::commands::ActiveMQQueue` (p. 481), `activemq::commands::ActiveMQStreamMessage` (p. 539), `activemq::commands::ActiveMQTempDestination` (p. 580), `activemq::commands::ActiveMQTempMessage` (p. 608), `activemq::commands::ActiveMQTempTopic` (p. 638), `activemq::commands::ActiveMQTextMessage` (p. 669), `activemq::commands::ActiveMQTopic` (p. 698), `activemq::commands::BooleanExpression` (p. 862), `activemq::commands::BrokerError` (p. 870), `activemq::commands::BrokerId` (p. 876), `activemq::commands::BrokerInfo` (p. 904), `activemq::commands::ConnectionControl` (p. 1303), `activemq::commands::ConnectionError` (p. 1333), `activemq::commands::ConnectionId` (p. 1366), `activemq::commands::ConnectionInfo` (p. 1395), `activemq::commands::ConsumerControl` (p. 1443), `activemq::commands::ConsumerId` (p. 1474), `activemq::commands::ConsumerInfo` (p. 1504), `activemq::commands::ControlCommand` (p. 1537), `activemq::commands::DataArrayResponse` (p. 1573), `activemq::commands::DataResponse` (p. 1633), `activemq::commands::DestinationInfo` (p. 1781), `activemq::commands::DiscoveryEvent` (p. 1813), `activemq::commands::ExceptionResponse` (p. 1896), `activemq::commands::FlushCommand` (p. 2000), `activemq::commands::IntegerResponse` (p. 2161), `activemq::commands::JournalQueueAck` (p. 2225), `activemq::commands::JournalTopicAck` (p. 2253), `activemq::commands::JournalTrace` (p. 2282), `activemq::commands::JournalTransaction` (p. 2309), `activemq::commands::KeepAliveInfo` (p. 2336), `activemq::commands::LastPartialCommand` (p. 2372), `activemq::commands::LocalTransactionId` (p. 2422), `activemq::commands::Message` (p. 2601), `activemq::commands::MessageAck` (p. 2644), `activemq::commands::MessageDispatch` (p. 2680), `activemq::commands::MessageDispatchNotification` (p. 2717), `activemq::commands::MessageId` (p. 2752), `activemq::commands::MessagePull` (p. 2825), `activemq::commands::NetworkBridgeFilter` (p. 2878), `activemq::commands::PartialCommand` (p. 3003), `activemq::commands::ProducerAck` (p. 3126), `activemq::commands::ProducerId` (p. 3158), `activemq::commands::ProducerInfo` (p. 3187), `activemq::commands::RemoveInfo` (p. 3285), `activemq::commands::RemoveSubscriptionInfo` (p. 3315), `activemq::commands::ReplayCommand` (p. 3345), `activemq::commands::Response` (p. 3380), `activemq::commands::SessionId` (p. 3478), `activemq::commands::SessionInfo` (p. 3506), `activemq::commands::ShutdownInfo` (p. 3574), `activemq::commands::SubscriptionInfo` (p. 3783), `activemq::commands::TransactionId` (p. 3933), `activemq::commands::TransactionInfo` (p. 3961), `activemq::commands::WireFormatInfo` (p. 4097), and `activemq::commands::XATransactionId` (p. 4144).

6.302.2.2 `virtual void activemq::commands::DataStructure::copyDataStructure (const DataStructure * src) [pure virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 186), `activemq::commands::ActiveMQBytesMessage` (p. 219), `activemq::commands::ActiveMQDestination` (p. 316), `activemq::commands::ActiveMQMapMessage` (p. 354), `activemq::commands::ActiveMQMessage` (p. 391), `activemq::commands::ActiveMQObjectMessage` (p. 439), `activemq::commands::ActiveMQQueue` (p. 481), `activemq::commands::ActiveMQStreamMessage` (p. 540), `activemq::commands::ActiveMQTempDestination` (p. 580), `activemq::commands::ActiveMQTempQueue` (p. 609), `activemq::commands::ActiveMQTempTopic` (p. 639), `activemq::commands::ActiveMQTextMessage` (p. 669), `activemq::commands::ActiveMQTopic` (p. 699), `activemq::commands::BaseCommand` (p. 766), `activemq::commands::BrokerError` (p. 870), `activemq::commands::BrokerId` (p. 876), `activemq::commands::BrokerInfo` (p. 904), `activemq::commands::ConnectionControl` (p. 1303), `activemq::commands::ConnectionError` (p. 1334), `activemq::commands::ConnectionId` (p. 1367), `activemq::commands::ConnectionInfo` (p. 1395), `activemq::commands::ConsumerControl` (p. 1443), `activemq::commands::ConsumerId` (p. 1474), `activemq::commands::ConsumerInfo` (p. 1504), `activemq::commands::ControlCommand` (p. 1537), `activemq::commands::DataArrayResponse` (p. 1573), `activemq::commands::DataResponse` (p. 1633), `activemq::commands::DestinationInfo` (p. 1781), `activemq::commands::DiscoveryEvent` (p. 1813), `activemq::commands::ExceptionResponse` (p. 1896), `activemq::commands::FlushCommand` (p. 2000), `activemq::commands::IntegerResponse` (p. 2161), `activemq::commands::JournalQueueAck` (p. 2225), `activemq::commands::JournalTopicAck` (p. 2253), `activemq::commands::JournalTrace` (p. 2282), `activemq::commands::JournalTransaction` (p. 2309), `activemq::commands::KeepAliveInfo` (p. 2336), `activemq::commands::LastPartialCommand` (p. 2372), `activemq::commands::LocalTransactionId` (p. 2422), `activemq::commands::Message` (p. 2602), `activemq::commands::MessageAck` (p. 2645), `activemq::commands::MessageDispatch` (p. 2680), `activemq::commands::MessageDispatchNotification` (p. 2718), `activemq::commands::MessageId` (p. 2752), `activemq::commands::MessagePull` (p. 2826), `activemq::commands::NetworkBridgeFilter` (p. 2878), `activemq::commands::PartialCommand` (p. 3003), `activemq::commands::ProducerAck` (p. 3126), `activemq::commands::ProducerId` (p. 3159), `activemq::commands::ProducerInfo` (p. 3187), `activemq::commands::RemoveInfo` (p. 3285), `activemq::commands::RemoveSubscriptionInfo` (p. 3315), `activemq::commands::ReplayCommand` (p. 3345), `activemq::commands::Response` (p. 3380), `activemq::commands::SessionId` (p. 3478), `activemq::commands::SessionInfo` (p. 3506), `activemq::commands::ShutdownInfo` (p. 3574), `activemq::commands::SubscriptionInfo` (p. 3784), `activemq::commands::TransactionId` (p. 3934), `activemq::commands::TransactionInfo` (p. 3961), `activemq::commands::WireFormatInfo` (p. 4097), and `activemq::commands::XATransactionId` (p. 4145).

6.302.2.3 `virtual bool activemq::commands::DataStructure::equals (const DataStructure * value) const [pure virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Returns

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 187), `activemq::commands::ActiveMQDestination` (p. 220), `activemq::commands::ActiveMQMessage` (p. 355), `activemq::commands::ActiveMQObjectMessage` (p. 423), `activemq::commands::ActiveMQStreamMessage` (p. 481), `activemq::commands::ActiveMQTempQueue` (p. 581), `activemq::commands::ActiveMQTextMessage` (p. 639), `activemq::commands::BaseCommand` (p. 699), `activemq::commands::BooleanExpression` (p. 862), `activemq::commands::BrokerId` (p. 876), `activemq::commands::BrokerInfo` (p. 905), `activemq::commands::ConnectionControl` (p. 1303), `activemq::commands::ConnectionError` (p. 1334), `activemq::commands::ConnectionId` (p. 1367), `activemq::commands::ConnectionInfo` (p. 1395), `activemq::commands::ConsumerControl` (p. 1443), `activemq::commands::ConsumerId` (p. 1475), `activemq::commands::ConsumerInfo` (p. 1504), `activemq::commands::ControlCommand` (p. 1538), `activemq::commands::DataArrayResponse` (p. 1573), `activemq::commands::DataResponse` (p. 1633), `activemq::commands::DestinationInfo` (p. 1781), `activemq::commands::DiscoveryEvent` (p. 1813), `activemq::commands::ExceptionResponse` (p. 1896), `activemq::commands::FlushCommand` (p. 2000), `activemq::commands::IntegerResponse` (p. 2161), `activemq::commands::JournalQueueAck` (p. 2226), `activemq::commands::JournalTopicAck` (p. 2254), `activemq::commands::JournalTrace` (p. 2282), `activemq::commands::JournalTransaction` (p. 2309), `activemq::commands::KeepAliveInfo` (p. 2337), `activemq::commands::LastPartialCommand` (p. 2373), `activemq::commands::LocalTransaction` (p. 2422), `activemq::commands::Message` (p. 2602), `activemq::commands::MessageAck` (p. 2645), `activemq::commands::MessageDispatch` (p. 2680), `activemq::commands::MessageDispatchNotified` (p. 2718), `activemq::commands::MessageId` (p. 2753), `activemq::commands::MessagePull` (p. 2826), `activemq::commands::NetworkBridgeFilter` (p. 2879), `activemq::commands::PartialCommand` (p. 3004), `activemq::commands::ProducerAck` (p. 3126), `activemq::commands::ProducerId` (p. 3159), `activemq::commands::ProducerInfo` (p. 3187), `activemq::commands::RemoveInfo` (p. 3286), `activemq::commands::RemoveSubscriptionInfo` (p. 3315), `activemq::commands::ReplayCommand` (p. 3345), `activemq::commands::Response` (p. 3381), `activemq::commands::SessionId` (p. 3479), `activemq::commands::SessionInfo` (p. 3507), `activemq::commands::ShutdownInfo` (p. 3574), `activemq::commands::SubscriptionInfo` (p. 3784), `activemq::commands::TransactionId` (p. 3934), `activemq::commands::TransactionInfo` (p. 3961), `activemq::commands::WireFormatInfo` (p. 4097), `activemq::commands::XATransactionId` (p. 4145), `activemq::commands::ActiveMQMessageTemplate` (p. 423), `activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >` (p. 423), `activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >` (p. 423), `activemq::commands::ActiveMQMessageTemplate< cms::Message >` (p. 423), `activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >` (p. 423), `activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >` (p. 423), and `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >` (p. 423).

Get the **DataStructure** (p. 1713) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 187), `activemq::commands::ActiveMQBytesMessage` (p. 221), `activemq::commands::ActiveMQDestination` (p. 317), `activemq::commands::ActiveMQMapMessage` (p. 356), `activemq::commands::ActiveMQMessage` (p. 392), `activemq::commands::ActiveMQObjectMessage` (p. 440), `activemq::commands::ActiveMQQueue` (p. 482), `activemq::commands::ActiveMQStreamMessage` (p. 540), `activemq::commands::ActiveMQTempDestination` (p. 581), `activemq::commands::ActiveMQTempQueue` (p. 610), `activemq::commands::ActiveMQTempTopic` (p. 640), `activemq::commands::ActiveMQTextMessage` (p. 669), `activemq::commands::ActiveMQTopic` (p. 700), `activemq::commands::BrokerError` (p. 871), `activemq::commands::BrokerId` (p. 877), `activemq::commands::BrokerInfo` (p. 906), `activemq::commands::ConnectionControl` (p. 1304), `activemq::commands::ConnectionError` (p. 1334), `activemq::commands::ConnectionId` (p. 1367), `activemq::commands::ConnectionInfo` (p. 1396), `activemq::commands::ConsumerControl` (p. 1444), `activemq::commands::ConsumerId` (p. 1475), `activemq::commands::ConsumerInfo` (p. 1505), `activemq::commands::ControlCommand` (p. 1538), `activemq::commands::DataArrayResponse` (p. 1574), `activemq::commands::DataResponse` (p. 1634), `activemq::commands::DestinationInfo` (p. 1782), `activemq::commands::DiscoveryEvent` (p. 1814), `activemq::commands::ExceptionResponse` (p. 1897), `activemq::commands::FlushCommand` (p. 2001), `activemq::commands::IntegerResponse` (p. 2162), `activemq::commands::JournalQueueAck` (p. 2226), `activemq::commands::JournalTopicAck` (p. 2254), `activemq::commands::JournalTrace` (p. 2283), `activemq::commands::JournalTransaction` (p. 2310), `activemq::commands::KeepAliveInfo` (p. 2337), `activemq::commands::LastPartialCommand` (p. 2373), `activemq::commands::LocalTransactionId` (p. 2423), `activemq::commands::Message` (p. 2604), `activemq::commands::MessageAck` (p. 2645), `activemq::commands::MessageDispatch` (p. 2681), `activemq::commands::MessageDispatchNotification` (p. 2718), `activemq::commands::MessageId` (p. 2753), `activemq::commands::MessagePull` (p. 2826), `activemq::commands::NetworkBridgeFilter` (p. 2879), `activemq::commands::PartialCommand` (p. 3004), `activemq::commands::ProducerAck` (p. 3127), `activemq::commands::ProducerId` (p. 3159), `activemq::commands::ProducerInfo` (p. 3188), `activemq::commands::RemoveInfo` (p. 3286), `activemq::commands::RemoveSubscriptionInfo` (p. 3316), `activemq::commands::ReplayCommand` (p. 3346), `activemq::commands::Response` (p. 3381), `activemq::commands::SessionId` (p. 3479), `activemq::commands::SessionInfo` (p. 3507), `activemq::commands::ShutdownInfo` (p. 3575), `activemq::commands::SubscriptionInfo` (p. 3784), `activemq::commands::TransactionId` (p. 3934), `activemq::commands::TransactionInfo` (p. 3962), `activemq::commands::WireFormatInfo` (p. 4098), and `activemq::commands::XATransactionId` (p. 4145).

6.302.2.5 `virtual std::string activemq::commands::DataStructure::toString () const [pure virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 189), `activemq::commands::ActiveMQBytesMessage` (p. 229), `activemq::commands::ActiveMQDestination` (p. 321), `activemq::commands::ActiveMQMapMessage` (p. 364), `activemq::commands::ActiveMQMessage` (p. 392), `activemq::commands::ActiveMQObjectMessage` (p. 440), `activemq::commands::ActiveMQQueue` (p. 483), `activemq::commands::ActiveMQStreamMessage`

(p. 547), `activemq::commands::ActiveMQTempDestination` (p. 582), `activemq::commands::ActiveMQTempTopic` (p. 611), `activemq::commands::ActiveMQTextMessage` (p. 671), `activemq::commands::ActiveMQTopic` (p. 701), `activemq::commands::BaseCommand` (p. 770), `activemq::commands::BaseDataStructure` (p. 841), `activemq::commands::BooleanExpression` (p. 863), `activemq::commands::BrokerId` (p. 877), `activemq::commands::BrokerInfo` (p. 908), `activemq::commands::Command` (p. 1231), `activemq::commands::ConnectionControl` (p. 1305), `activemq::commands::ConnectionError` (p. 1335), `activemq::commands::ConnectionId` (p. 1368), `activemq::commands::ConnectionInfo` (p. 1398), `activemq::commands::ConsumerControl` (p. 1445), `activemq::commands::ConsumerId` (p. 1476), `activemq::commands::ConsumerInfo` (p. 1507), `activemq::commands::ControlCommand` (p. 1538), `activemq::commands::DataArrayResponse` (p. 1574), `activemq::commands::DataResponse` (p. 1634), `activemq::commands::DestinationInfo` (p. 1783), `activemq::commands::DiscoveryEvent` (p. 1814), `activemq::commands::ExceptionResponse` (p. 1897), `activemq::commands::FlushCommand` (p. 2001), `activemq::commands::IntegerResponse` (p. 2162), `activemq::commands::JournalQueueAck` (p. 2227), `activemq::commands::JournalTopicAck` (p. 2255), `activemq::commands::JournalTrace` (p. 2283), `activemq::commands::JournalTransaction` (p. 2310), `activemq::commands::KeepAliveInfo` (p. 2337), `activemq::commands::LastPartialCommand` (p. 2373), `activemq::commands::LocalTransactionId` (p. 2424), `activemq::commands::Message` (p. 2611), `activemq::commands::MessageAck` (p. 2647), `activemq::commands::MessageDispatch` (p. 2682), `activemq::commands::MessageDispatchNotification` (p. 2719), `activemq::commands::MessageId` (p. 2754), `activemq::commands::MessagePull` (p. 2827), `activemq::commands::NetworkBridgeFilter` (p. 2880), `activemq::commands::PartialCommand` (p. 3005), `activemq::commands::ProducerAck` (p. 3127), `activemq::commands::ProducerId` (p. 3160), `activemq::commands::ProducerInfo` (p. 3189), `activemq::commands::RemoveInfo` (p. 3287), `activemq::commands::RemoveSubscriptionInfo` (p. 3317), `activemq::commands::ReplayCommand` (p. 3346), `activemq::commands::Response` (p. 3382), `activemq::commands::SessionId` (p. 3480), `activemq::commands::SessionInfo` (p. 3507), `activemq::commands::ShutdownInfo` (p. 3575), `activemq::commands::SubscriptionInfo` (p. 3785), `activemq::commands::TransactionId` (p. 3935), `activemq::commands::TransactionInfo` (p. 3963), `activemq::commands::WireFormatInfo` (p. 4104), and `activemq::commands::XATransactionId` (p. 4146).

6.303 decaf::util::Date Class Reference

Wrapper class around a time value in milliseconds.

```
#include <src/main/decaf/util/Date.h>
```

Inheritance diagram for `decaf::util::Date`:

Public Member Functions

- `Date ()`

Default constructor - sets time to the current System time, rounded to the nearest millisecond.

- **Date** (long long milliseconds)
Constructs the date with a given time value.
- **Date** (const **Date** &source)
Copy constructor.
- **Date & operator=** (const **Date** &value)
*Assigns the value of one **Date** (p. 1719) object to another.*
- virtual ~**Date** ()
- long long **getTime** () const
Gets the underlying time.
- void **setTime** (long long milliseconds)
Sets the underlying time.
- bool **after** (const **Date** &when) const
Determines whether or not this date falls after the specified time.
- bool **before** (const **Date** &when) const
Determines whether or not this date falls before the specified time.
- std::string **toString** () const
*Converts this **Date** (p. 1719) object to a String of the form:*
- virtual int **compareTo** (const **Date** &value) const
Compares this Data object to the one given.
- virtual bool **equals** (const **Date** &value) const
- virtual bool **operator==** (const **Date** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Date** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

6.303.1 Detailed Description

Wrapper class around a time value in milliseconds. This class is comparable to Java's java.util.Date class.

Since

1.0

6.303.2 Constructor & Destructor Documentation

6.303.2.1 `decaf::util::Date::Date ()`

Default constructor - sets time to the current System time, rounded to the nearest millisecond.

6.303.2.2 `decaf::util::Date::Date (long long milliseconds)`

Constructs the date with a given time value.

Parameters

<i>milliseconds</i>	The time in milliseconds;
---------------------	---------------------------

6.303.2.3 `decaf::util::Date::Date (const Date & source)`

Copy constructor.

Parameters

<i>source</i>	The Date (p. 1719) instance to copy into this one.
---------------	---

6.303.2.4 `virtual decaf::util::Date::~~Date ()` `[virtual]`

6.303.3 Member Function Documentation

6.303.3.1 `bool decaf::util::Date::after (const Date & when) const`

Determines whether or not this date falls after the specified time.

Parameters

<i>when</i>	The date to compare
-------------	---------------------

Returns

true if this date falls after when.

6.303.3.2 `bool decaf::util::Date::before (const Date & when) const`

Determines whether or not this date falls before the specified time.

Parameters

<i>when</i>	The date to compare
-------------	---------------------

Returns

true if this date falls before when.

6.303.3.3 `virtual int decaf::util::Date::compareTo (const Date & value) const` `[virtual]`

Compares this Date object to the one given.

Parameters

<i>value</i>	The Date (p. 1719) value to compare to this one.
--------------	---

Returns

zero if the **Date** (p. 1719) values are equal, a value less than zero if this Date value is earlier than argument value, and a value greater than zero if this **Date** (p. 1719) object is later than the argument **Date** (p. 1719) value.

6.303.3.4 `virtual bool decaf::util::Date::equals (const Date & value) const` `[virtual]`

Returns

true if this value is considered equal to the passed value.

6.303.3.5 `long long decaf::util::Date::getTime () const`

Gets the underlying time.

Returns

The underlying time value in milliseconds.

6.303.3.6 `virtual bool decaf::util::Date::operator< (const Date & value) const`
`[virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

6.303.3.7 Date& decaf::util::Date::operator= (const Date & value)

Assigns the value of one **Date** (p. 1719) object to another.

Parameters

<i>value</i>	The value to be copied into this Date (p. 1719) object.
--------------	--

Returns

reference to this object with the newly assigned value.

6.303.3.8 virtual bool decaf::util::Date::operator== (const Date & value) const
[virtual]

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

6.303.3.9 void decaf::util::Date::setTime (long long milliseconds)

Sets the underlying time.

Parameters

<i>milliseconds</i>	The underlying time value in milliseconds.
---------------------	--

6.303.3.10 std::string decaf::util::Date::toString () const

Converts this **Date** (p. 1719) object to a String of the form:

dow mon dd hh:mm:ss zzz yyyy

where:

- dow is the day of the week (Sun, Mon, Tue, Wed, Thu, Fri, Sat).
- mon is the month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec).
- dd is the day of the month (01 through 31), as two decimal digits.
- hh is the hour of the day (00 through 23), as two decimal digits.
- mm is the minute within the hour (00 through 59), as two decimal digits.

- ss is the second within the minute (00 through 61, as two decimal digits).
- zzz is the time zone (and may reflect daylight saving time). Standard time zone abbreviations include those recognized by the method parse. If time zone information is not available, then zzz is empty - that is, it consists of no characters at all.
- yyyy is the year, as four decimal digits.

Returns

the String representation of the **Date** (p. 1719) object.

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Date.h**

6.304 decaf::internal::DecafRuntime Class Reference

Handles APR initialization and termination.

```
#include <src/main/decaf/internal/DecafRuntime.h>
```

Inheritance diagram for decaf::internal::DecafRuntime:

Public Member Functions

- **DecafRuntime ()**
Initializes the APR Runtime for a library.
- virtual **~DecafRuntime ()**
Terminates the APR Runtime for a library.
- apr_pool_t * **getGlobalPool ()** const
Grants access to the Global APR Pool instance that should be used when creating new threads.

6.304.1 Detailed Description

Handles APR initialization and termination.

6.304.2 Constructor & Destructor Documentation

6.304.2.1 decaf::internal::DecafRuntime::DecafRuntime ()

Initializes the APR Runtime for a library.

6.304.2.2 virtual decaf::internal::DecafRuntime::~~DecafRuntime () [virtual]

Terminates the APR Runtime for a library.

6.304.3 Member Function Documentation

6.304.3.1 apr_pool_t* decaf::internal::DecafRuntime::getGlobalPool () const

Grants access to the Global APR Pool instance that should be used when creating new threads.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**DecafRuntime.h**

6.305 activemq::threads::DedicatedTaskRunner Class Reference

```
#include <src/main/activemq/threads/DedicatedTaskRunner.h>
```

Inheritance diagram for activemq::threads::DedicatedTaskRunner:

Public Member Functions

- **DedicatedTaskRunner** (Task *task)
- virtual ~**DedicatedTaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)
Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()
Shutdown once the task has finished and the TaskRunner's thread has exited.
- virtual void **wakeup** ()
*Signal the **TaskRunner** (p. 3849) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3846) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()
Run method - called by the Thread class in the context of the thread.

6.305.1 Constructor & Destructor Documentation

6.305.1.1 `activemq::threads::DedicatedTaskRunner::DedicatedTaskRunner (Task * task)`

6.305.1.2 `virtual activemq::threads::DedicatedTaskRunner::~~DedicatedTaskRunner ()`
[virtual]

6.305.2 Member Function Documentation

6.305.2.1 `virtual void activemq::threads::DedicatedTaskRunner::run ()` [protected,
virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 3419).

6.305.2.2 `virtual void activemq::threads::DedicatedTaskRunner::shutdown ()` [virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implements **activemq::threads::TaskRunner** (p. 3849).

6.305.2.3 `virtual void activemq::threads::DedicatedTaskRunner::shutdown (unsigned int
timeout)` [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

<i>timeout</i>	- Time in Milliseconds to wait for the task to stop.
----------------	--

Implements **activemq::threads::TaskRunner** (p. 3849).

6.305.2.4 `virtual void activemq::threads::DedicatedTaskRunner::wakeup ()` [virtual]

Signal the **TaskRunner** (p. 3849) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3846) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 3850).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/DedicatedTaskRunner.h`

6.306 activemq::core::policies::DefaultPrefetchPolicy Class Reference

```
#include <src/main/activemq/core/policies/DefaultPrefetchPolicy.h>
```

Inheritance diagram for activemq::core::policies::DefaultPrefetchPolicy:

Public Member Functions

- **DefaultPrefetchPolicy ()**
- virtual **~DefaultPrefetchPolicy ()**
- virtual void **setDurableTopicPrefetch** (int value)
Sets the amount of prefetched messages for a Durable Topic.
- virtual int **getDurableTopicPrefetch** () const
Gets the amount of messages to prefetch for a Durable Topic.
- virtual void **setQueuePrefetch** (int value)
Sets the amount of prefetched messages for a Queue.
- virtual int **getQueuePrefetch** () const
Gets the amount of messages to prefetch for a Queue.
- virtual void **setQueueBrowserPrefetch** (int value)
Sets the amount of prefetched messages for a Queue Browser.
- virtual int **getQueueBrowserPrefetch** () const
Gets the amount of messages to prefetch for a Queue Browser.
- virtual void **setTopicPrefetch** (int value)
Sets the amount of prefetched messages for a Topic.
- virtual int **getTopicPrefetch** () const
Gets the amount of messages to prefetch for a Topic.
- virtual int **getMaxPrefetchLimit** (int value) const
Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.
- virtual **PrefetchPolicy * clone** () const
Clone the Policy and return a new pointer to that clone.

Static Public Attributes

- static int **MAX_PREFETCH_SIZE**
- static int **DEFAULT_DURABLE_TOPIC_PREFETCH**
- static int **DEFAULT_QUEUE_PREFETCH**
- static int **DEFAULT_QUEUE_BROWSER_PREFETCH**
- static int **DEFAULT_TOPIC_PREFETCH**

6.306.1 Constructor & Destructor Documentation

6.306.1.1 **activemq::core::policies::DefaultPrefetchPolicy::DefaultPrefetchPolicy ()**

6.306.1.2 **virtual activemq::core::policies::DefaultPrefetchPolicy::~~DefaultPrefetchPolicy ()**
[virtual]

6.306.2 Member Function Documentation

6.306.2.1 **virtual PrefetchPolicy* activemq::core::policies::DefaultPrefetchPolicy::clone ()**
const [virtual]

Clone the Policy and return a new pointer to that clone.

Returns

pointer to a new **PrefetchPolicy** (p. 3062) instance that is a clone of this one.

Implements **activemq::core::PrefetchPolicy** (p. 3064).

6.306.2.2 **virtual int activemq::core::policies::DefaultPrefetchPolicy::getDurableTopicPrefetch () const** [inline, virtual]

Gets the amount of messages to prefetch for a Durable Topic.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 3065).

6.306.2.3 **virtual int activemq::core::policies::DefaultPrefetchPolicy::getMaxPrefetchLimit (int value) const** [inline, virtual]

Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

Returns

the allowable value for a prefetch limit, either requested or the max.

Implements **activemq::core::PrefetchPolicy** (p. 3065).

6.306.2.4 `virtual int activemq::core::policies::DefaultPrefetchPolicy::getQueueBrowserPrefetch () const [inline, virtual]`

Gets the amount of messages to prefetch for a Queue Browser.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 3065).

6.306.2.5 `virtual int activemq::core::policies::DefaultPrefetchPolicy::getQueuePrefetch () const [inline, virtual]`

Gets the amount of messages to prefetch for a Queue.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 3065).

6.306.2.6 `virtual int activemq::core::policies::DefaultPrefetchPolicy::getTopicPrefetch () const [inline, virtual]`

Gets the amount of messages to prefetch for a Topic.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 3066).

6.306.2.7 `virtual void activemq::core::policies::DefaultPrefetchPolicy::setDurableTopicPrefetch (int value) [inline, virtual]`

Sets the amount of prefetched messages for a Durable Topic.

Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implements **activemq::core::PrefetchPolicy** (p. 3066).

6.306.2.8 `virtual void activemq::core::policies::DefaultPrefetchPolicy::setQueueBrowserPrefetch (int value) [inline, virtual]`

Sets the amount of prefetched messages for a Queue Browser.

Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implements **activemq::core::PrefetchPolicy** (p. 3066).

6.306.2.9 `virtual void activemq::core::policies::DefaultPrefetchPolicy::setQueuePrefetch (int value) [inline, virtual]`

Sets the amount of prefetched messages for a Queue.

Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implements **activemq::core::PrefetchPolicy** (p. 3066).

6.306.2.10 `virtual void activemq::core::policies::DefaultPrefetchPolicy::setTopicPrefetch (int value) [inline, virtual]`

Sets the amount of prefetched messages for a Topic.

Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implements **activemq::core::PrefetchPolicy** (p. 3067).

6.306.3 Field Documentation

- 6.306.3.1 `int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_DURABLE_TOPIC_PREFETCH` `[static]`
- 6.306.3.2 `int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_QUEUE_BROWSER_PREFETCH` `[static]`
- 6.306.3.3 `int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_QUEUE_PREFETCH` `[static]`
- 6.306.3.4 `int activemq::core::policies::DefaultPrefetchPolicy::DEFAULT_TOPIC_PREFETCH` `[static]`

6.307 `activemq::core::policies::DefaultRedeliveryPolicy` Class Reference

```
#include <src/main/activemq/core/policies/DefaultRedeliveryPolicy.h>
```

Inheritance diagram for `activemq::core::policies::DefaultRedeliveryPolicy`:

Public Member Functions

- `DefaultRedeliveryPolicy ()`
- `virtual ~DefaultRedeliveryPolicy ()`
- `virtual double getBackOffMultiplier () const`
- `virtual void setBackOffMultiplier (double value)`
Sets the Back-Off Multiplier for Message Redelivery.
- `virtual short getCollisionAvoidancePercent () const`
- `virtual void setCollisionAvoidancePercent (short value)`
- `virtual long long getInitialRedeliveryDelay () const`
Gets the initial time that redelivery of messages is delayed.
- `virtual void setInitialRedeliveryDelay (long long value)`
Sets the initial time that redelivery will be delayed.

- virtual int **getMaximumRedeliveries** () const
Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.
- virtual void **setMaximumRedeliveries** (int value)
Sets the Maximum allowable redeliveries for a Message.
- virtual bool **isUseCollisionAvoidance** () const
- virtual void **setUseCollisionAvoidance** (bool value)
- virtual bool **isUseExponentialBackOff** () const
- virtual void **setUseExponentialBackOff** (bool value)
- virtual long long **getRedeliveryDelay** (long long previousDelay)
Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.
- virtual **RedeliveryPolicy** * **clone** () const
Create a copy of this Policy and return it.

6.307.1 Constructor & Destructor Documentation

6.307.1.1 **activemq::core::policies::DefaultRedeliveryPolicy::DefaultRedeliveryPolicy** ()

6.307.1.2 **virtual activemq::core::policies::DefaultRedeliveryPolicy::~~DefaultRedeliveryPolicy** () [virtual]

6.307.2 Member Function Documentation

6.307.2.1 **virtual RedeliveryPolicy* activemq::core::policies::DefaultRedeliveryPolicy::clone** () const [virtual]

Create a copy of this Policy and return it.

Returns

pointer to a new **RedeliveryPolicy** (p. 3267) that is a copy of this one.

Implements **activemq::core::RedeliveryPolicy** (p. 3269).

6.307.2.2 **virtual double activemq::core::policies::DefaultRedeliveryPolicy::getBackOffMultiplier** () const [inline, virtual]

Returns

The value of the Back-Off Multiplier for Message Redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 3270).

6.307.2.3 `virtual short activemq::core::policies::DefaultRedeliveryPolicy::getCollisionAvoidancePercent () const [virtual]`

Returns

the currently set Collision Avoidance percentage.

Implements **activemq::core::RedeliveryPolicy** (p. 3270).

6.307.2.4 `virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getInitialRedeliveryDelay () const [inline, virtual]`

Gets the initial time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed initially.

Implements **activemq::core::RedeliveryPolicy** (p. 3270).

6.307.2.5 `virtual int activemq::core::policies::DefaultRedeliveryPolicy::getMaximumRedeliveries () const [inline, virtual]`

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

Returns

maximum allowed redeliveries for a message.

Implements **activemq::core::RedeliveryPolicy** (p. 3270).

6.307.2.6 `virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getRedeliveryDelay (long long previousDelay) [virtual]`

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

Parameters

<i>previousDelay</i>	The last delay that was used between message redeliveries.
----------------------	--

Returns

the new delay to use before attempting another redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 3270).

6.307.2.7 `virtual bool activemq::core::policies::DefaultRedeliveryPolicy::isUseCollisionAvoidance () const [inline, virtual]`

Returns

whether or not collision avoidance is enabled for this Policy.

Implements **activemq::core::RedeliveryPolicy** (p. 3271).

6.307.2.8 `virtual bool activemq::core::policies::DefaultRedeliveryPolicy::isUseExponentialBackOff () const [inline, virtual]`

Returns

whether or not the exponential back off option is enabled.

Implements **activemq::core::RedeliveryPolicy** (p. 3271).

6.307.2.9 `virtual void activemq::core::policies::DefaultRedeliveryPolicy::setBackOffMultiplier (double value) [inline, virtual]`

Sets the Back-Off Multiplier for Message Redelivery.

Parameters

<i>value</i>	The new value for the back-off multiplier.
--------------	--

Implements **activemq::core::RedeliveryPolicy** (p. 3271).

6.307.2.10 `virtual void activemq::core::policies::DefaultRedeliveryPolicy::setCollisionAvoidancePercent (short value) [virtual]`

Parameters

<i>value</i>	The collision avoidance percentage setting.
--------------	---

Implements **activemq::core::RedeliveryPolicy** (p. 3271).

6.307.2.11 `virtual void activemq::core::policies::DefaultRedeliveryPolicy::setInitialRedeliveryDelay (long long value) [inline, virtual]`

Sets the initial time that redelivery will be delayed.

Parameters

<i>value</i>	Time in Milliseconds to wait before starting redelivery.
--------------	--

Implements **activemq::core::RedeliveryPolicy** (p. 3272).

6.307.2.12 `virtual void activemq::core::policies::DefaultRedeliveryPolicy::setMaximumRedeliveries (int maximumRedeliveries) [inline, virtual]`

Sets the Maximum allowable redeliveries for a Message.

Parameters

<i>maximum-Redeliveries</i>	The maximum number of times that a message will be redelivered.
-----------------------------	---

Implements `activemq::core::RedeliveryPolicy` (p. 3272).

6.307.2.13 `virtual void activemq::core::policies::DefaultRedeliveryPolicy::setUseCollisionAvoidance (bool value) [inline, virtual]`

Parameters

<i>value</i>	Enable or Disable collision avoidance for this Policy.
--------------	--

Implements `activemq::core::RedeliveryPolicy` (p. 3272).

6.307.2.14 `virtual void activemq::core::policies::DefaultRedeliveryPolicy::setUseExponentialBackOff (bool value) [inline, virtual]`

Parameters

<i>value</i>	Enable or Disable the exponential back off multiplier option.
--------------	---

Implements `activemq::core::RedeliveryPolicy` (p. 3272).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/policies/DefaultRedeliveryPolicy.h`

6.308 decaf::internal::net::DefaultServerSocketFactory Class Reference

Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.

```
#include <src/main/decaf/internal/net/DefaultServerSocketFactory.h>
```

Inheritance diagram for `decaf::internal::net::DefaultServerSocketFactory`:

Public Member Functions

- **DefaultServerSocketFactory** ()
- virtual **~DefaultServerSocketFactory** ()
- virtual **decaf::net::ServerSocket * createServerSocket** ()

Create a new *ServerSocket* (p. 3447) that is unbound.
The *ServerSocket* (p. 3447) will have been configured with the defaults from the factory.

Returns

new *ServerSocket* (p. 3447) pointer that is owned by the caller.

Exceptions

IOException	if the <i>ServerSocket</i> (p. 3447) cannot be created for some reason.
-------------	---

- virtual **decaf::net::ServerSocket * createServerSocket** (int port)

Create a new *ServerSocket* (p. 3447) that is bound to the given port.
The *ServerSocket* (p. 3447) will have been configured with the defaults from the factory.

Parameters

port	The port to bind the <i>ServerSocket</i> (p. 3447) to.
------	--

Returns

new *ServerSocket* (p. 3447) pointer that is owned by the caller.

Exceptions

IOException	if the <i>ServerSocket</i> (p. 3447) cannot be created for some reason.
-------------	---

- virtual **decaf::net::ServerSocket * createServerSocket** (int port, int backlog)

Create a new *ServerSocket* (p. 3447) that is bound to the given port.
The *ServerSocket* (p. 3447) will have been configured with the defaults from the factory. The *ServerSocket* (p. 3447) will use the specified connection backlog setting.

Parameters

port	The port to bind the <i>ServerSocket</i> (p. 3447) to.
backlog	The number of pending connect request the <i>ServerSocket</i> (p. 3447) can queue.

Returns

new *ServerSocket* (p. 3447) pointer that is owned by the caller.

Exceptions

IOException	if the <i>ServerSocket</i> (p. 3447) cannot be created for some reason.
-------------	---

- virtual **decaf::net::ServerSocket * createServerSocket** (int port, int backlog, const **decaf::net::InetAddress** *address)

Create a new *ServerSocket* (p. 3447) that is bound to the given port.
The *ServerSocket* (p. 3447) will have been configured with the defaults from the factory. The *ServerSocket* (p. 3447) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the *ServerSocket* (p. 3447) will listen on all interfaces.

Parameters

port	<i>The port to bind the ServerSocket (p. 3447) to.</i>
backlog	<i>The number of pending connect request the ServerSocket (p. 3447) can queue.</i>
address	<i>The address of the interface on the local machine to bind to.</i>

Returns

*new **ServerSocket** (p. 3447) pointer that is owned by the caller.*

Exceptions

IOException	<i>if the ServerSocket (p. 3447) cannot be created for some reason.</i>
-------------	--

6.308.1 Detailed Description

Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.

Since

1.0

6.308.2 Constructor & Destructor Documentation

6.308.2.1 `decaf::internal::net::DefaultServerSocketFactory::DefaultServerSocketFactory ()`

6.308.2.2 `virtual decaf::internal::net::DefaultServerSocketFactory::~~DefaultServerSocketFactory () [virtual]`

6.308.3 Member Function Documentation

6.308.3.1 `virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket () [virtual]`

Create a new **ServerSocket** (p. 3447) that is unbound.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory.

Returns

*new **ServerSocket** (p. 3447) pointer that is owned by the caller.*

Exceptions

IOException	<i>if the ServerSocket (p. 3447) cannot be created for some reason.</i>
-------------	--

Reimplemented from **decaf::net::ServerSocketFactory** (p. 3458).

6.308.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port*, int *backlog*, const decaf::net::InetAddress * *address*) [virtual]

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 3447) will listen on all interfaces.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 3447) to.
<i>backlog</i>	The number of pending connect request the ServerSocket (p. 3447) can queue.
<i>address</i>	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3459).

6.308.3.3 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port*, int *backlog*) [virtual]

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will use the specified connection backlog setting.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 3447) to.
<i>backlog</i>	The number of pending connect request the ServerSocket (p. 3447) can queue.

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3459).

6.308.3.4 `virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int port)`
`[virtual]`

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 3447) to.
-------------	--

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3458).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/DefaultServerSocketFactory.h`

6.309 decaf::internal::net::DefaultSocketFactory Class Reference

SocketFactory implementation that is used to create Sockets.

```

```

Inheritance diagram for `decaf::internal::net::DefaultSocketFactory`:

Public Member Functions

- **DefaultSocketFactory** ()
- virtual **~DefaultSocketFactory** ()
- virtual **decaf::net::Socket * createSocket** () throw (decaf::io::IOException)

*Creates an unconnected **Socket** (p. 3607) object.*

Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

Exceptions

<i>IOException</i>	if the Socket (p. 3607) cannot be created.
--------------------	---

- virtual **decaf::net::Socket * createSocket** (const **decaf::net::InetAddress** *host, int port) throw (**decaf::io::IOException**, **decaf::net::UnknownHostException**)

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

Parameters

host	<i>The host to connect the socket to.</i>
port	<i>The port on the remote host to connect to.</i>

Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

Exceptions

IOException	<i>if an I/O error occurs while creating the Socket (p. 3607) object.</i>
UnknownHostException (p. 4019)	<i>if the host name is not known.</i>

- virtual **decaf::net::Socket * createSocket** (const **decaf::net::InetAddress** *host, int port, const **decaf::net::InetAddress** *ifAddress, int localPort) throw (**decaf::io::IOException**, **decaf::net::UnknownHostException**)

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

*The **Socket** (p. 3607) will be bound to the specified local address and port.*

Parameters

host	<i>The host to connect the socket to.</i>
port	<i>The port on the remote host to connect to.</i>
ifAddress	<i>The address on the local machine to bind the Socket (p. 3607) to.</i>
localPort	<i>The local port to bind the Socket (p. 3607) to.</i>

Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

Exceptions

IOException	<i>if an I/O error occurs while creating the Socket (p. 3607) object.</i>
UnknownHostException (p. 4019)	<i>if the host name is not known.</i>

- virtual **decaf::net::Socket * createSocket** (const std::string &name, int port) throw (**decaf::io::IOException**, **decaf::net::UnknownHostException**)

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

Parameters

host	<i>The host name or IP address to connect the socket to.</i>
port	<i>The port on the remote host to connect to.</i>

Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

Exceptions

IOException	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

- virtual **decaf::net::Socket * createSocket** (const std::string &name, int port, const **decaf::net::InetAddress** *ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the Socket (p. 3607) to.
localPort	The local port to bind the Socket (p. 3607) to.

Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

Exceptions

IOException	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

6.309.1 Detailed Description

SocketFactory implementation that is used to create Sockets.

Since

1.0

6.309.2 Constructor & Destructor Documentation

6.309.2.1 `decaf::internal::net::DefaultSocketFactory::DefaultSocketFactory ()`

6.309.2.2 `virtual decaf::internal::net::DefaultSocketFactory::~~DefaultSocketFactory ()`
[virtual]

6.309.3 Member Function Documentation

6.309.3.1 `virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket () throw (decaf::io::IOException)` [virtual]

Creates an unconnected **Socket** (p. 3607) object.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if the Socket (p. 3607) cannot be created.
--------------------	---

Reimplemented from **decaf::net::SocketFactory** (p. 3631).

6.309.3.2 `virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const std::string & name, int port, const decaf::net::InetAddress * ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)` [virtual]

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the Socket (p. 3607) to.
<i>localPort</i>	The local port to bind the Socket (p. 3607) to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
<i>UnknownHostException</i> (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3632).

6.309.3.3 `virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket
(const std::string & name, int port) throw (decaf::io::IOException,
decaf::net::UnknownHostException) [virtual]`

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
<i>UnknownHostException</i> (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3632).

6.309.3.4 `virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket
(const decaf::net::InetAddress * host, int port, const de-
caf::net::InetAddress * ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)
[virtual]`

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

The **Socket** (p. 3607) will be bound to the specified local address and port.

Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the Socket (p. 3607) to.
<i>localPort</i>	The local port to bind the Socket (p. 3607) to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3633).

6.309.3.5 `virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket
(const decaf::net::InetAddress * host, int port) throw (de-
caf::io::IOException, decaf::net::UnknownHostException)
[virtual]`

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3631).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**DefaultSocketFactory.h**

6.310 decaf::internal::net::ssl::DefaultSSLContext Class Reference

Default SSLContext manager for the Decaf library.

```
#include <src/main/decaf/internal/net/ssl/DefaultSSLContext.h>
```

Public Member Functions

- virtual **~DefaultSSLContext** ()

Static Public Member Functions

6.311 decaf::internal::net::ssl::DefaultSSLServerSocketFactory Class Reference

Default implementation of the SSLServerSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

```
#include <src/main/decaf/internal/net/ssl/DefaultSSLServerSocketFactory.h>
```

6.311 decaf::internal::net::ssl::DefaultSSLServerSocketFactory Class Reference 1747

Inheritance diagram for decaf::internal::net::ssl::DefaultSSLServerSocketFactory:

Public Member Functions

- **DefaultSSLServerSocketFactory** (const std::string &errorMessage)
- virtual ~**DefaultSSLServerSocketFactory** ()
- virtual **decaf::net::ServerSocket * createServerSocket** ()

Create a new *ServerSocket* (p. 3447) that is unbound.

The *ServerSocket* (p. 3447) will have been configured with the defaults from the factory.

Returns

new *ServerSocket* (p. 3447) pointer that is owned by the caller.

Exceptions

IOException	if the <i>ServerSocket</i> (p. 3447) cannot be created for some reason.
-------------	---

- virtual **decaf::net::ServerSocket * createServerSocket** (int port)

Create a new *ServerSocket* (p. 3447) that is bound to the given port.

The *ServerSocket* (p. 3447) will have been configured with the defaults from the factory.

Parameters

port	The port to bind the <i>ServerSocket</i> (p. 3447) to.
------	--

Returns

new *ServerSocket* (p. 3447) pointer that is owned by the caller.

Exceptions

IOException	if the <i>ServerSocket</i> (p. 3447) cannot be created for some reason.
-------------	---

- virtual **decaf::net::ServerSocket * createServerSocket** (int port, int backlog)

Create a new *ServerSocket* (p. 3447) that is bound to the given port.

The *ServerSocket* (p. 3447) will have been configured with the defaults from the factory. The *ServerSocket* (p. 3447) will use the specified connection backlog setting.

Parameters

port	The port to bind the <i>ServerSocket</i> (p. 3447) to.
backlog	The number of pending connect request the <i>ServerSocket</i> (p. 3447) can queue.

Returns

new *ServerSocket* (p. 3447) pointer that is owned by the caller.

Exceptions

IOException	if the <i>ServerSocket</i> (p. 3447) cannot be created for some reason.
-------------	---

- virtual **decaf::net::ServerSocket * createServerSocket** (int port, int backlog,

const **decaf::net::InetAddress** *address)

Create a new **ServerSocket** (p. 3447) that is bound to the given port. The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 3447) will listen on all interfaces.

Parameters

port	The port to bind the ServerSocket (p. 3447) to.
backlog	The number of pending connect request the ServerSocket (p. 3447) can queue.
address	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

IOException	if the ServerSocket (p. 3447) cannot be created for some reason.
-------------	---

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

Returns the list of cipher suites which are enabled by default. Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 3670)

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

Returns the names of the cipher suites which could be enabled for use on an SSL connection. Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

getDefaultCipherSuites() (p. 3669)

6.311.1 Detailed Description

Default implementation of the SSLServerSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

Since

1.0

6.311 decaf::internal::net::ssl::DefaultSSLServerSocketFactory Class Reference 1749

6.311.2.2 `virtual decaf::internal::net::ssl::DefaultSSLServerSocketFactory::~~DefaultSSLServerSocketFactory () [virtual]`

6.311.3 Member Function Documentation

6.311.3.1 `virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket () [virtual]`

Create a new **ServerSocket** (p. 3447) that is unbound.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 3447) cannot be created for some reason.
--------------------	---

Reimplemented from **decaf::net::ServerSocketFactory** (p. 3458).

6.311.3.2 `virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int port) [virtual]`

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 3447) to.
-------------	--

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3458).

6.311.3.3 `virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int port, int backlog, const decaf::net::InetAddress * address) [virtual]`

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 3447) will listen on all interfaces.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 3447) to.
<i>backlog</i>	The number of pending connect request the ServerSocket (p. 3447) can queue.
<i>address</i>	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3459).

6.311.3.4 `virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int port, int backlog) [virtual]`

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will use the specified connection backlog setting.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 3447) to.
<i>backlog</i>	The number of pending connect request the ServerSocket (p. 3447) can queue.

Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3459).

6.312 `decaf::internal::net::ssl::DefaultSSLSocketFactory` Class Reference 1751

6.311.3.5 `virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLServerSocketFactory::getDefaultCipherSuites ()`
[virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

`getSupportedCipherSuites()` (p. 3670)

Implements `decaf::net::ssl::SSLServerSocketFactory` (p. 3669).

6.311.3.6 `virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLServerSocketFactory::getSupportedCipherSuites ()`
[virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

`getDefaultCipherSuites()` (p. 3669)

Implements `decaf::net::ssl::SSLServerSocketFactory` (p. 3670).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/DefaultSSLServerSocketFactory.h`

6.312 `decaf::internal::net::ssl::DefaultSSLSocketFactory` Class Reference

Default implementation of the `SSLSocketFactory`, this factory throws an `Exception` from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

```
#include <src/main/decaf/internal/net/ssl/DefaultSSLSocketFactory.h>
```

Inheritance diagram for decaf::internal::net::ssl::DefaultSSLSocketFactory:

Public Member Functions

- **DefaultSSLSocketFactory** (const std::string &errorMessage)
- virtual ~**DefaultSSLSocketFactory** ()
- virtual **decaf::net::Socket** * **createSocket** () throw (decaf::io::IOException)

*Creates an unconnected **Socket** (p. 3607) object.*

Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

Exceptions

IOException	<i>if the Socket (p. 3607) cannot be created.</i>
-------------	--

- virtual **decaf::net::Socket** * **createSocket** (const **decaf::net::InetAddress** *host, int port) throw (decaf::io::IOException, decaf::net::UnknownHostException)

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

Parameters

host	<i>The host to connect the socket to.</i>
port	<i>The port on the remote host to connect to.</i>

Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

Exceptions

IOException	<i>if an I/O error occurs while creating the Socket (p. 3607) object.</i>
UnknownHostException (p. 4019)	<i>if the host name is not known.</i>

- virtual **decaf::net::Socket** * **createSocket** (const **decaf::net::InetAddress** *host, int port, const **decaf::net::InetAddress** *ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

*The **Socket** (p. 3607) will be bound to the specified local address and port.*

Parameters

host	<i>The host to connect the socket to.</i>
port	<i>The port on the remote host to connect to.</i>
ifAddress	<i>The address on the local machine to bind the Socket (p. 3607) to.</i>
localPort	<i>The local port to bind the Socket (p. 3607) to.</i>

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

- virtual **decaf::net::Socket * createSocket** (const std::string &name, int port) throw (decaf::io::IOException, decaf::net::UnknownHostException)

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

- virtual **decaf::net::Socket * createSocket** (const std::string &name, int port, const **decaf::net::InetAddress** *ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the Socket (p. 3607) to.
localPort	The local port to bind the Socket (p. 3607) to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

`getSupportedCipherSuites()` (p. 3682)

- virtual `std::vector< std::string > getSupportedCipherSuites ()`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

`getDefaultCipherSuites()` (p. 3681)

- virtual `decaf::net::Socket * createSocket (decaf::net::Socket *socket, std::string host, int port, bool autoClose)`

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

socket	The existing socket to layer over.
host	The server host the original Socket (p. 3607) is connected to.
port	The server port the original Socket (p. 3607) is connected to.
autoClose	Should the layered over Socket (p. 3607) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 3607) instance that wraps the given **Socket** (p. 3607).

Exceptions

IOException	if an I/O exception occurs while performing this operation.
UnknownHostException (p. 4019)	if the host is unknown.

6.312.1 Detailed Description

Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

1.0

6.312.2 Constructor & Destructor Documentation

6.312.2.1 `decaf::internal::net::ssl::DefaultSSLSocketFactory::DefaultSSLSocketFactory (const std::string & errorMessage)`

6.312.2.2 `virtual decaf::internal::net::ssl::DefaultSSLSocketFactory::~~DefaultSSLSocketFactory () [virtual]`

6.312.3 Member Function Documentation

6.312.3.1 `virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket () throw (decaf::io::IOException) [virtual]`

Creates an unconnected **Socket** (p. 3607) object.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if the Socket (p. 3607) cannot be created.
--------------------	---

Reimplemented from **decaf::net::SocketFactory** (p. 3631).

6.312.3.2 `virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (decaf::net::Socket * socket, std::string host, int port, bool autoClose) [virtual]`

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

<i>socket</i>	The existing socket to layer over.
---------------	------------------------------------

<i>host</i>	The server host the original Socket (p. 3607) is connected to.
<i>port</i>	The server port the original Socket (p. 3607) is connected to.
<i>autoClose</i>	Should the layered over Socket (p. 3607) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 3607) instance that wraps the given **Socket** (p. 3607).

Exceptions

<i>IOException</i>	if an I/O exception occurs while performing this operation.
UnknownHostException (p. 4019)	if the host is unknown.

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3680).

```
6.312.3.3  virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket
( const decaf::net::InetAddress * host, int port ) throw ( de-
caaf::io::IOException, decaf::net::UnknownHostException )
[virtual]
```

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3631).

6.312 decaf::internal::net::ssl::DefaultSSLSocketFactory Class Reference 1757

6.312.3.4 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const std::string & *name*, int *port*) throw (decaf::io::IOException, decaf::net::UnknownHostException) [virtual]

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3632).

6.312.3.5 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const std::string & *name*, int *port*, const decaf::net::InetAddress * *ifAddress*, int *localPort*) throw (decaf::io::IOException, decaf::net::UnknownHostException) [virtual]

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the Socket (p. 3607) to.
<i>localPort</i>	The local port to bind the Socket (p. 3607) to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
UnknownHostException (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3632).

6.312.3.6 `virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const decaf::net::InetAddress * host, int port, const decaf::net::InetAddress * ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)`
[virtual]

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

The **Socket** (p. 3607) will be bound to the specified local address and port.

Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the Socket (p. 3607) to.
<i>localPort</i>	The local port to bind the Socket (p. 3607) to.

Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 3607) object.
<i>UnknownHostException</i> (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3633).

6.312.3.7 `virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLSocketFactory::getDefaultCipherSuites ()`
[virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 3682)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3681).

6.312.3.8 `virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLSocketFactory::getSupportedCipherSuites ()`
`[virtual]`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

`getDefaultCipherSuites()` (p. 3681)

Implements `decaf::net::ssl::SSLSocketFactory` (p. 3682).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/DefaultSSLSocketFactory.h`

6.313 activemq::transport::DefaultTransportListener Class Reference

```
#include <src/main/activemq/transport/DefaultTransportListener.h>
```

Inheritance diagram for `activemq::transport::DefaultTransportListener`:

Public Member Functions

- `virtual ~DefaultTransportListener ()`
- `virtual void onCommand (const Pointer< Command > &command AMQCPP_UNUSED)`
Event handler for the receipt of a command.
- `virtual void onException (const decaf::lang::Exception &ex AMQCPP_UNUSED)`
Event handler for an exception from a command transport.
- `virtual void transportInterrupted ()`
The transport has suffered an interruption from which it hopes to recover.
- `virtual void transportResumed ()`
The transport has resumed after an interruption.

6.313.1 Constructor & Destructor Documentation

6.313.1.1 `virtual activemq::transport::DefaultTransportListener::~~DefaultTransportListener ()`
`[inline, virtual]`

6.313.2 Member Function Documentation

6.313.2.1 `virtual void activemq::transport::DefaultTransportListener::onCommand (const`
`Pointer< Command > &command AMQCPP_UNUSED) [inline,`
`virtual]`

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3996) deletes the command upon receipt.

Parameters

<i>command</i>	the received command object.
----------------	------------------------------

6.313.2.2 `virtual void activemq::transport::DefaultTransportListener::onException (const`
`decaf::lang::Exception &ex AMQCPP_UNUSED) [inline, virtual]`

Event handler for an exception from a command transport.

Parameters

<i>ex</i>	The exception.
-----------	----------------

6.313.2.3 `virtual void activemq::transport::DefaultTransportListener::transportInterrupted ()`
`[inline, virtual]`

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 4015).

6.313.2.4 `virtual void activemq::transport::DefaultTransportListener::transportResumed ()`
`[inline, virtual]`

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 4015).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/DefaultTransportListener.h`

6.314 decaf::util::zip::Deflater Class Reference

This class compresses data using the *DEFLATE* algorithm (see *specification*).

```
#include <src/main/decaf/util/zip/Deflater.h>
```

Public Member Functions

- **Deflater** (int level, bool nowrap=false)
Creates a new compressor using the specified compression level.
- **Deflater** ()
Creates a new compressor with the default compression level.
- virtual **~Deflater** ()
- void **setInput** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Sets input data for compression.
- void **setInput** (const std::vector< unsigned char > &buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Sets input data for compression.
- void **setInput** (const std::vector< unsigned char > &buffer) throw (decaf::lang::exceptions::IllegalStateException)
Sets input data for compression.
- void **setDictionary** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Sets preset dictionary for compression.
- void **setDictionary** (const std::vector< unsigned char > &buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Sets preset dictionary for compression.
- void **setDictionary** (const std::vector< unsigned char > &buffer) throw (decaf::lang::exceptions::IllegalStateException)
Sets preset dictionary for compression.
- void **setStrategy** (int strategy) throw (decaf::lang::exceptions::IllegalArgumentOutOfRangeException, decaf::lang::exceptions::IllegalStateException)
Sets the compression strategy to the specified value.

- void **setLevel** (int level) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Sets the compression level to the specified value.
- bool **needsInput** () const
- void **finish** ()
When called, indicates that compression should end with the current contents of the input buffer.
- bool **finished** () const
- int **deflate** (unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Fills specified buffer with compressed data.
- int **deflate** (std::vector< unsigned char > &buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Fills specified buffer with compressed data.
- int **deflate** (std::vector< unsigned char > &buffer) throw (decaf::lang::exceptions::IllegalStateException)
Fills specified buffer with compressed data.
- long long **getAdler** () const throw (decaf::lang::exceptions::IllegalStateException)
- long long **getBytesRead** () const throw (decaf::lang::exceptions::IllegalStateException)
- long long **getBytesWritten** () const throw (decaf::lang::exceptions::IllegalStateException)
- void **reset** () throw (decaf::lang::exceptions::IllegalStateException)
Resets deflater so that a new set of input data can be processed.
- void **end** ()
Closes the compressor and discards any unprocessed input.

Static Public Attributes

- static const int **BEST_SPEED**
Compression level for fastest compression.
- static const int **BEST_COMPRESSION**
Compression level for best compression.
- static const int **DEFAULT_COMPRESSION**
Default compression level.

- static const int **DEFLATED**
Compression method for the deflate algorithm (the only one currently supported).
- static const int **NO_COMPRESSION**
Compression level for no compression.
- static const int **FILTERED**
Compression strategy best used for data consisting mostly of small values with a somewhat random distribution.
- static const int **HUFFMAN_ONLY**
Compression strategy for Huffman coding only.
- static const int **DEFAULT_STRATEGY**
Default compression strategy.

6.314.1 Detailed Description

This class compresses data using the *DEFLATE* algorithm (see [specification](#)). Basically this class is part of the API to the stream based ZLIB compression library and is used as such by **DeflaterOutputStream** (p. 1769) and its descendants.

The typical usage of a **Deflater** (p. 1759) instance outside this package consists of a specific call to one of its constructors before being passed to an instance of **DeflaterOutputStream** (p. 1769).

See also

DeflaterOutputStream (p. 1769)
Inflater (p. 2088)

Since

1.0

6.314.2 Constructor & Destructor Documentation

6.314.2.1 decaf::util::zip::Deflater::Deflater (int *level*, bool *nowrap* = false)

Creates a new compressor using the specified compression level.

If 'nowrap' is true then the ZLIB header and checksum fields will not be used in order to support the compression format used in both GZIP and PKZIP.

Parameters

<i>level</i>	The compression level to use (0-9).
<i>nowrap</i>	If true uses GZip compatible compression (defaults to false).

6.314.2.2 decaf::util::zip::Deflater::Deflater ()

Creates a new compressor with the default compression level.

Compressed data will be generated in ZLIB format.

6.314.2.3 virtual decaf::util::zip::Deflater::~~Deflater () [virtual]

6.314.3 Member Function Documentation

6.314.3.1 int decaf::util::zip::Deflater::deflate (unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)

Fills specified buffer with compressed data.

Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 1764) should be called in order to determine if more input data is required.

Parameters

<i>buffer</i>	The Buffer to write the compressed data to.
<i>size</i>	The size of the passed buffer.
<i>offset</i>	The position in the Buffer to start writing at.
<i>length</i>	The maximum number of byte of data to write.

Returns

the actual number of bytes of compressed data.

Exceptions

<i>NullPointerException</i>	if buffer is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length > size of the buffer.
<i>IllegalStateException</i>	if in the end state.

6.314.3.2 int decaf::util::zip::Deflater::deflate (std::vector< unsigned char > & *buffer*, int *offset*, int *length*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)

Fills specified buffer with compressed data.

Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 1764) should be called in order to determine if more input data is required.

Parameters

<i>buffer</i>	The Buffer to write the compressed data to.
<i>offset</i>	The position in the Buffer to start writing at.
<i>length</i>	The maximum number of byte of data to write.

Returns

the actual number of bytes of compressed data.

Exceptions

<i>IndexOutOfBoundsException</i>	if the offset + length > size of the buffer.
<i>IllegalStateException</i>	if in the end state.

6.314.3.3 int decaf::util::zip::Deflater::deflate (std::vector< unsigned char > & *buffer*) throw (decaf::lang::exceptions::IllegalStateException)

Fills specified buffer with compressed data.

Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 1764) should be called in order to determine if more input data is required.

Parameters

<i>buffer</i>	The Buffer to write the compressed data to.
---------------	---

Returns

the actual number of bytes of compressed data.

Exceptions

<i>IllegalStateException</i>	if in the end state.
------------------------------	----------------------

6.314.3.4 void decaf::util::zip::Deflater::end ()

Closes the compressor and discards any unprocessed input.

This method should be called when the compressor is no longer being used, but will also be called automatically by the destructor. Once this method is called, the behavior of the **Deflater** (p. 1759) object is undefined.

6.314.3.5 void decaf::util::zip::Deflater::finish ()

When called, indicates that compression should end with the current contents of the input buffer.

6.314.3.6 `bool decaf::util::zip::Deflater::finished () const`

Returns

true if the end of the compressed data output stream has been reached.

6.314.3.7 `long long decaf::util::zip::Deflater::getAdler () const throw (decaf::lang::exceptions::IllegalStateException)`

Returns

the ADLER-32 value of the uncompressed data.

Exceptions

<i>IllegalStateException</i>	if in the end state.
------------------------------	----------------------

6.314.3.8 `long long decaf::util::zip::Deflater::getBytesRead () const throw (decaf::lang::exceptions::IllegalStateException)`

Returns

the total number of uncompressed bytes input so far.

Exceptions

<i>IllegalStateException</i>	if in the end state.
------------------------------	----------------------

6.314.3.9 `long long decaf::util::zip::Deflater::getBytesWritten () const throw (decaf::lang::exceptions::IllegalStateException)`

Returns

the total number of compressed bytes output so far.

Exceptions

<i>IllegalStateException</i>	if in the end state.
------------------------------	----------------------

6.314.3.10 `bool decaf::util::zip::Deflater::needsInput () const`

Returns

true if the input data buffer is empty and **setInput()** (p. 1767) should be called in order to provide more input

6.314.3.11 void decaf::util::zip::Deflater::reset () throw (decaf::lang::exceptions::IllegalStateException)

Resets deflater so that a new set of input data can be processed.

Keeps current compression level and strategy settings.

Exceptions

<i>IllegalStateException</i>	if in the end state.
------------------------------	----------------------

6.314.3.12 void decaf::util::zip::Deflater::setDictionary (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)

Sets preset dictionary for compression.

A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 2093), **Inflater.getAdler()** (p. 2091) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters

<i>buffer</i>	The buffer containing the preset dictionary.
<i>offset</i>	The position in the Buffer to start reading from.
<i>length</i>	The number of bytes to read from the input buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if the offset + length > size of the buffer.
<i>IllegalStateException</i>	if in the end state.

6.314.3.13 void decaf::util::zip::Deflater::setDictionary (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)

Sets preset dictionary for compression.

A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 2093), **Inflater.getAdler()** (p. 2091) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters

<i>buffer</i>	The buffer containing the preset dictionary.
<i>size</i>	The size of the passed dictionary buffer.
<i>offset</i>	The position in the Buffer to start reading from.
<i>length</i>	The number of bytes to read from the input buffer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length > size of the buffer.
<i>IllegalStateException</i>	if in the end state.

6.314.3.14 `void decaf::util::zip::Deflater::setDictionary (const std::vector< unsigned char > & buffer) throw (decaf::lang::exceptions::IllegalStateException)`

Sets preset dictionary for compression.

A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p.2093), **Inflater.getAdler()** (p.2091) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters

<i>buffer</i>	The buffer containing the preset dictionary.
---------------	--

Exceptions

<i>IllegalStateException</i>	if in the end state.
------------------------------	----------------------

6.314.3.15 `void decaf::util::zip::Deflater::setInput (const std::vector< unsigned char > & buffer) throw (decaf::lang::exceptions::IllegalStateException)`

Sets input data for compression.

This should be called whenever **needsInput()** (p.1764) returns true indicating that more input data is required.

Parameters

<i>buffer</i>	The Buffer to read in for compression.
---------------	--

Exceptions

<i>IllegalStateException</i>	if in the end state.
------------------------------	----------------------

6.314.3.16 void decaf::util::zip::Deflater::setInput (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)

Sets input data for compression.

This should be called whenever **needsInput()** (p. 1764) returns true indicating that more input data is required.

Parameters

<i>buffer</i>	The Buffer to read in for compression.
<i>offset</i>	The position in the Buffer to start reading from.
<i>length</i>	The number of bytes to read from the input buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if the offset + length > size of the buffer.
<i>IllegalStateException</i>	if in the end state.

6.314.3.17 void decaf::util::zip::Deflater::setInput (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)

Sets input data for compression.

This should be called whenever **needsInput()** (p. 1764) returns true indicating that more input data is required.

Parameters

<i>buffer</i>	The Buffer to read in for compression.
<i>size</i>	The size in bytes of the buffer passed.
<i>offset</i>	The position in the Buffer to start reading from.
<i>length</i>	The number of bytes to read from the input buffer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length > size of the buffer.
<i>IllegalStateException</i>	if in the end state.

6.314.3.18 `void decaf::util::zip::Deflater::setLevel (int level) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Sets the compression level to the specified value.

Parameters

<i>level</i>	The new Compression level to use.
--------------	-----------------------------------

Exceptions

<i>IllegalArgumentException</i>	if the level value is invalid.
<i>IllegalStateException</i>	if in the end state.

6.314.3.19 `void decaf::util::zip::Deflater::setStrategy (int strategy) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Sets the compression strategy to the specified value.

Parameters

<i>strategy</i>	The new Compression strategy to use.
-----------------	--------------------------------------

Exceptions

<i>IllegalArgumentException</i>	if the strategy value is invalid.
<i>IllegalStateException</i>	if in the end state.

6.314.4 Field Documentation

6.314.4.1 `const int decaf::util::zip::Deflater::BEST_COMPRESSION` [static]

Compression level for best compression.

6.314.4.2 `const int decaf::util::zip::Deflater::BEST_SPEED` [static]

Compression level for fastest compression.

6.314.4.3 `const int decaf::util::zip::Deflater::DEFAULT_COMPRESSION` [static]

Default compression level.

6.314.4.4 `const int decaf::util::zip::Deflater::DEFAULT_STRATEGY` [static]

Default compression strategy.

6.314.4.5 `const int decaf::util::zip::Deflater::DEFLATED` [static]

Compression method for the deflate algorithm (the only one currently supported).

6.314.4.6 `const int decaf::util::zip::Deflater::FILTERED` [static]

Compression strategy best used for data consisting mostly of small values with a somewhat random distribution.

Forces more Huffman coding and less string matching.

6.314.4.7 `const int decaf::util::zip::Deflater::HUFFMAN_ONLY` [static]

Compression strategy for Huffman coding only.

6.314.4.8 `const int decaf::util::zip::Deflater::NO_COMPRESSION` [static]

Compression level for no compression.

6.315.1 Detailed Description

Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.

Since

1.0

6.315.2 Constructor & Destructor Documentation

6.315.2.1 `decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (
 decaf::io::OutputStream * outputStream, bool own = false)`

Creates a new DeflateOutputStream with a Default **Deflater** (p. 1759) and buffer size.

Parameters

<i>output-Stream</i>	The OutputStream instance to wrap.
<i>own</i>	Should this filter take ownership of the OutputStream pointer (default is false).

6.315.2.2 `decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (
 decaf::io::OutputStream * outputStream, Deflater * deflater, bool own = false)`

Creates a new DeflateOutputStream with a user supplied **Deflater** (p. 1759) and a default buffer size.

When the user supplied a **Deflater** (p. 1759) instance the DeflaterOutpotStream does not take ownership of the **Deflater** (p. 1759) pointer, the caller is still responsible for deleting the **Deflater** (p. 1759).

Parameters

<i>output-Stream</i>	The OutputStream instance to wrap.
<i>deflater</i>	The user supplied Deflater (p. 1759) to use for compression. (
<i>own</i>	Should this filter take ownership of the OutputStream pointer (default is false).

Exceptions

<i>NullPointerException</i>	if the Deflater (p. 1759) given is NULL.
-----------------------------	---

6.315.2.3 `decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (decaf::io::OutputStream * outputStream, Deflater * deflater, int bufferSize, bool own = false)`

Creates a new DeflateOutputStream with a user supplied **Deflater** (p. 1759) and specified buffer size.

When the user supplied a **Deflater** (p. 1759) instance the DeflaterOutputpotStream does not take ownership of the **Deflater** (p. 1759) pointer, the caller is still responsible for deleting the **Deflater** (p. 1759).

Parameters

<i>output-Stream</i>	The OutputStream instance to wrap.
<i>deflater</i>	The user supplied Deflater (p. 1759) to use for compression.
<i>bufferSize</i>	The size of the input buffer.
<i>own</i>	Should this filter take ownership of the OutputStream pointer (default is false).

Exceptions

<i>NullPointerException</i>	if the Deflater (p. 1759) given is NULL.
<i>IllegalArgumentException</i>	if bufferSize is 0.

6.315.2.4 `virtual decaf::util::zip::DeflaterOutputStream::~~DeflaterOutputStream ()`
[virtual]

6.315.3 Member Function Documentation

6.315.3.1 `virtual void decaf::util::zip::DeflaterOutputStream::close () throw (decaf::io::IOException)` [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>IOException</i> (p. 2210)	if an error occurs while closing.
------------------------------	-----------------------------------

The default implementation of this method does nothing.

The close method of **FilterOutputStream** (p. 1957) calls its flush method, and then calls the close method of its underlying output stream.

Finishes writing any remaining data to the OutputStream then closes the stream.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1959).

6.315.3.2 virtual void decaf::util::zip::DeflaterOutputStream::deflate () throw (decaf::io::IOException) [protected, virtual]

Writes a buffers worth of compressed data to the wrapped OutputStream.

6.315.3.3 virtual void decaf::util::zip::DeflaterOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1960).

6.315.3.4 virtual void decaf::util::zip::DeflaterOutputStream::doWriteByte (unsigned char *value*) throw (decaf::io::IOException) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1960).

6.315.3.5 virtual void decaf::util::zip::DeflaterOutputStream::finish () throw (decaf::io::IOException) [virtual]

Finishes writing any remaining data to the wrapped OutputStream but does not close it upon completion.

Exceptions

<i>IOException</i>	if an I/O error occurs.
--------------------	-------------------------

6.315.4 Field Documentation

6.315.4.1 std::vector<unsigned char> decaf::util::zip::DeflaterOutputStream::buf [protected]

The Buffer to use for.

6.315.4.2 `const std::size_t decaf::util::zip::DeflaterOutputStream::DEFAULT_BUFFER_SIZE` [static, protected]

6.315.4.3 `Deflater* decaf::util::zip::DeflaterOutputStream::deflater` [protected]

The **Deflater** (p. 1759) for this stream.

6.315.4.4 `bool decaf::util::zip::DeflaterOutputStream::isDone` [protected]

6.315.4.5 `bool decaf::util::zip::DeflaterOutputStream::ownDeflater` [protected]

6.316 decaf::util::concurrent::Delayed Class Reference

A mix-in style interface for marking objects that should be acted upon after a given delay.

```
#include <src/main/decaf/util/concurrent/Delayed.h>
```

Inheritance diagram for `decaf::util::concurrent::Delayed`:

Public Member Functions

- virtual `~Delayed()`
- virtual long long `getDelay` (const **TimeUnit** &unit)=0

Returns the remaining delay associated with this object, in the given time unit.

6.316.1 Detailed Description

A mix-in style interface for marking objects that should be acted upon after a given delay. An implementation of this interface must define a `Comparable` methods that provides an ordering consistent with its `getDelay` method.

6.316.2 Constructor & Destructor Documentation

6.316.2.1 virtual decaf::util::concurrent::Delayed::~Delayed () [inline, virtual]

6.316.3 Member Function Documentation

6.316.3.1 virtual long long decaf::util::concurrent::Delayed::getDelay (const TimeUnit & unit) [pure virtual]

Returns the remaining delay associated with this object, in the given time unit.

Parameters

<i>unit</i>	The time unit
-------------	---------------

Returns

the remaining delay; zero or negative values indicate that the delay has already elapsed

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/Delayed.h

6.317 cms::DeliveryMode Class Reference

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

```
#include <src/main/cms/DeliveryMode.h>
```

Public Types

- enum **DELIVERY_MODE** { **PERSISTENT** = 0, **NON_PERSISTENT** = 1 }

*Enumeration values for **Message** (p. 2614) Delivery Mode.*

Public Member Functions

- virtual ~**DeliveryMode** ()

6.317.1 Detailed Description

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages. When a client sends a **cms::Message** (p. 2614)

it can mark the **Message** (p. 2614) as either Persistent or Non-Persistent. If the client feels that the **Message** (p. 2614) cannot be lost in transit it should mark it as Persistent, otherwise if it is allowable for a **Message** (p. 2614) to occasionally be lost it can mark it as Non-Persistent. This allows the Provider to balance make tradeoffs between balance and **Message** (p. 2614) throughput.

The **DeliveryMode** (p. 1775) covers only the transport of the **Message** (p. 2614) for sending client to its destination and doesn't apply to the receiving **Message** (p. 2614) consumer. The receiving Consumer can drop Message's based on configuration such as memory limits or **Message** (p. 2614) filtering.

A message is guaranteed to be delivered once and only once by a CMS provider if the delivery mode of the message is PERSISTENT and the configuration of the **Message** (p. 2614) consumer allows for it.

Since

1.0

6.317.2 Member Enumeration Documentation

6.317.2.1 enum cms::DeliveryMode::DELIVERY_MODE

Enumeration values for **Message** (p. 2614) Delivery Mode.

Enumerator:

PERSISTENT

NON_PERSISTENT

6.318 cms::Destination Class Reference

A **Destination** (p. 1776) object encapsulates a provider-specific address.

```
#include <src/main/cms/Destination.h>
```

Inheritance diagram for cms::Destination:

Public Types

- enum **DestinationType** { **TOPIC**, **QUEUE**, **TEMPORARY_TOPIC**, **TEMPORARY_QUEUE** }

Public Member Functions

- virtual **~Destination** ()
- virtual **DestinationType** **getDestinationType** () const =0
*Retrieve the **Destination** (p. 1776) Type for this **Destination** (p. 1776).*
- virtual **cms::Destination** * **clone** () const =0
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const **cms::Destination** &source)=0
*Copies the contents of the given **Destination** (p. 1776) object to this one.*
- virtual const **CMSProperties** & **getCMSProperties** () const =0
Retrieve any properties that might be part of the destination that was specified.

6.318.1 Detailed Description

A **Destination** (p. 1776) object encapsulates a provider-specific address. There is no standard definition of a **Destination** (p. 1776) address, each provider can provide its own definition and there can be configuration data attached to the **Destination** (p. 1776) address.

All CMS **Destination** (p. 1776) objects support concurrent use.

Since

1.0

6.318.2 Member Enumeration Documentation

6.318.2.1 enum cms::Destination::DestinationType

Enumerator:

TOPIC

QUEUE

TEMPORARY_TOPIC

TEMPORARY_QUEUE

6.318.3 Constructor & Destructor Documentation

6.318.3.1 `virtual cms::Destination::~~Destination () [inline, virtual]`

6.318.4 Member Function Documentation

6.318.4.1 `virtual cms::Destination* cms::Destination::clone () const [pure virtual]`

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implemented in `activemq::commands::ActiveMQQueue` (p. 480), `activemq::commands::ActiveMQTempQueue` (p. 608), `activemq::commands::ActiveMQTempTopic` (p. 638), and `activemq::commands::ActiveMQTopic` (p. 698).

6.318.4.2 `virtual void cms::Destination::copy (const cms::Destination & source) [pure virtual]`

Copies the contents of the given **Destination** (p. 1776) object to this one.

Parameters

<i>source</i>	The source Destination (p. 1776) object.
---------------	---

Implemented in `activemq::commands::ActiveMQQueue` (p. 481), `activemq::commands::ActiveMQTempQueue` (p. 608), `activemq::commands::ActiveMQTempTopic` (p. 638), and `activemq::commands::ActiveMQTopic` (p. 699).

6.318.4.3 `virtual const CMSProperties& cms::Destination::getCMSProperties () const [pure virtual]`

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a **CMSProperties** (p. 1195) object.

Implemented in `activemq::commands::ActiveMQQueue` (p. 482), `activemq::commands::ActiveMQTempQueue` (p. 610), `activemq::commands::ActiveMQTempTopic` (p. 640), and `activemq::commands::ActiveMQTopic` (p. 700).

6.319 activemq::commands::ActiveMQDestination::DestinationFilter Struct Reference 1781

6.318.4.4 `virtual DestinationType cms::Destination::getDestinationType () const` [pure virtual]

Retrieve the **Destination** (p. 1776) Type for this **Destination** (p. 1776).

Returns

The **Destination** (p. 1776) Type

Implemented in **activemq::commands::ActiveMQQueue** (p. 482), **activemq::commands::ActiveMQTempQueue** (p. 610), **activemq::commands::ActiveMQTempTopic** (p. 640), and **activemq::commands::ActiveMQTopic** (p. 700).

The documentation for this class was generated from the following file:

6.320 activemq::commands::DestinationInfo Class Reference

```
#include <src/main/activemq/commands/DestinationInfo.h>
```

Inheritance diagram for **activemq::commands::DestinationInfo**:

Public Member Functions

- **DestinationInfo** ()
- virtual **~DestinationInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DestinationInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual unsigned char **getOperationType** () const
- virtual void **setOperationType** (unsigned char operationType)
- virtual long long **getTimeout** () const
- virtual void **setTimeout** (long long timeout)
- virtual const std::vector< **decaf::lang::Pointer**< **BrokerId** > > & **getBrokerPath** () const
- virtual std::vector< **decaf::lang::Pointer**< **BrokerId** > > & **getBrokerPath** ()
- virtual void **setBrokerPath** (const std::vector< **decaf::lang::Pointer**< **BrokerId** > > &brokerPath)
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (**exceptions::ActiveMQException**)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_DESTINATIONINFO** = 8

Protected Attributes

- **Pointer< ConnectionId > connectionId**
- **Pointer< ActiveMQDestination > destination**
- unsigned char **operationType**
- long long **timeout**
- std::vector< **decaf::lang::Pointer< BrokerId > > brokerPath**

6.320.1 Constructor & Destructor Documentation

6.320.1.1 **activemq::commands::DestinationInfo::DestinationInfo ()**

6.320.1.2 **virtual activemq::commands::DestinationInfo::~~DestinationInfo ()** [virtual]

6.320.2 Member Function Documentation

6.320.2.1 **virtual DestinationInfo* activemq::commands::DestinationInfo::cloneDataStructure () const** [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

6.320.2.2 **virtual void activemq::commands::DestinationInfo::copyDataStructure (const DataStructure * src)** [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

6.320.2.3 **virtual bool activemq::commands::DestinationInfo::equals (const DataStructure * value) const** [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

6.320.2.4 **virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath () const** [virtual]

6.320.2.5 **virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath ()** [virtual]

6.320.2.6 **virtual const Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId () const** [virtual]

6.320.2.7 **virtual Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId ()** [virtual]

6.320.2.8 **virtual unsigned char activemq::commands::DestinationInfo::getDataStructureType () const** [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

- 6.320.2.9 **virtual const Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination () const** [virtual]
- 6.320.2.10 **virtual Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination ()** [virtual]
- 6.320.2.11 **virtual unsigned char activemq::commands::DestinationInfo::getOperationType () const** [virtual]
- 6.320.2.12 **virtual long long activemq::commands::DestinationInfo::getTimeout () const** [virtual]
- 6.320.2.13 **virtual void activemq::commands::DestinationInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath)** [virtual]
- 6.320.2.14 **virtual void activemq::commands::DestinationInfo::setConnectionId (const Pointer< ConnectionId > & connectionId)** [virtual]
- 6.320.2.15 **virtual void activemq::commands::DestinationInfo::setDestination (const Pointer< ActiveMQDestination > & destination)** [virtual]
- 6.320.2.16 **virtual void activemq::commands::DestinationInfo::setOperationType (unsigned char operationType)** [virtual]
- 6.320.2.17 **virtual void activemq::commands::DestinationInfo::setTimeout (long long timeout)** [virtual]
- 6.320.2.18 **virtual std::string activemq::commands::DestinationInfo::toString () const** [virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

- 6.320.2.19 **virtual Pointer<Command> activemq::commands::DestinationInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)** [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

6.320.3 Field Documentation

- 6.320.3.1 **std::vector< decaf::lang::Pointer<BrokerId> >**
activemq::commands::DestinationInfo::brokerPath [protected]

6.321 **activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1784).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/DestinationInfo
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller**:

Public Member Functions

- **DestinationInfoMarshaller ()**
- **virtual ~DestinationInfoMarshaller ()**

- virtual **commands::DataStructure * createObject ()** const

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType ()** const

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs)**
throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual int **tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs)** throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs)** throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn)** throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut)** throw (decaf::io::IOException)

Write a object instance to data output stream.

6.321.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1784).
NOTE!: This file is auto generated - do not modify! if you need to make a change,

6.321.2 Constructor & Destructor Documentation

6.321.2.1 `activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::DestinationInfoMarshaller () [inline]`

6.321.2.2 `virtual activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::~~DestinationInfoMarshaller () [inline, virtual]`

6.321.3 Member Function Documentation

6.321.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.321.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.321.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

6.321.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

6.321.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 810).

```
6.321.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 811).

```
6.321.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 813).

The documentation for this class was generated from the following file:

6.322.3 Member Function Documentation

6.322.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::createObject** (
) **const** [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.322.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::getDataStructureType**
 () **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.322.3.3 **virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseMarshal**
 (**OpenWireFormat * wireFormat**, **commands::DataStructure**
 * **dataStructure**, **decaf::io::DataOutputStream * dataOut**) **throw** (
decaf::io::IOException) [virtual]

Write a object instance to data output stream.

6.322 activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller

Class Reference 1793

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

6.322.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

6.322.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

```
6.322.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

```
6.322.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.323 activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller

Class Reference

1795

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

6.323.3 Member Function Documentation

- 6.323.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

- 6.323.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::getDataStructureType**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

6.323 activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller

Class Reference 1797

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.323.3.3 virtual void **activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::looseMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

6.323.3.4 virtual void **activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```

6.323.3.5 virtual int activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 782).

```

6.323.3.6 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 783).

6.324 activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller Class Reference 1799

6.323.3.7 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**DestinationInfoMarshaller.h**

6.324 activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1797).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/DestinationInfoMarshaller
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller:

Public Member Functions

- **DestinationInfoMarshaller** ()
- virtual **~DestinationInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.324.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1797).

() [inline]

6.324.2.2 **virtual activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::~~DestinationInfoMarshaller**
() [inline, virtual]

6.324.3 Member Function Documentation

6.324.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.324.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.324.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

6.324.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

```
6.324.3.5 virtual int activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```
6.324.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

6.325 activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller

Class Reference

1803

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

6.324.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

6.325.3 Member Function Documentation

6.325.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.325.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.325.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

6.325.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

6.325.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.325 activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller

Class Reference

1807

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 803).

```
6.325.3.6 virtual void activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataOutputStream * dataOut,
 utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 804).

```
6.325.3.7 virtual void activemq::wireformat::openwire::marshal::v6::DestinationInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
 dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
 * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

6.326.3 Member Function Documentation

6.326.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.326.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::getDataStructureType
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.326.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

6.326.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

6.326.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 796).

6.326.3.6 virtual void activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 797).

6.326.3.7 virtual void activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i> if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**DestinationInfoMarshaller.h**

6.327 activemq::cmsutil::DestinationResolver Class Reference

Resolves a CMS destination name to a *Destination*.

```
#include <src/main/activemq/cmsutil/DestinationResolver.h>
```

Inheritance diagram for **activemq::cmsutil::DestinationResolver**:

Public Member Functions

- virtual **~DestinationResolver** ()
- virtual void **init** (**ResourceLifecycleManager** *mgr)=0
Initializes this destination resolver for use.
- virtual void **destroy** ()=0
Destroys any allocated resources.
- virtual **cms::Destination** * **resolveDestinationName** (**cms::Session** *session, const std::string &destName, bool pubSubDomain)=0 throw (cms::CMSException)
Resolves the given name to a destination.

6.327.1 Detailed Description

Resolves a CMS destination name to a *Destination*.

6.327.2 Constructor & Destructor Documentation

6.327.2.1 `virtual activemq::cmsutil::DestinationResolver::~~DestinationResolver ()`
`[inline, virtual]`

6.327.3 Member Function Documentation

6.327.3.1 `virtual void activemq::cmsutil::DestinationResolver::destroy ()` `[pure virtual]`

Destroys any allocated resources.

Implemented in `activemq::cmsutil::DynamicDestinationResolver` (p. 1879).

6.327.3.2 `virtual void activemq::cmsutil::DestinationResolver::init (`
`ResourceLifecycleManager * mgr)` `[pure virtual]`

Initializes this destination resolver for use.

Ensures that any previously allocated resources are first destroyed (e.g. calls `destroy()` (p. 1811)).

Parameters

<i>mgr</i>	the resource lifecycle manager.
------------	---------------------------------

Implemented in `activemq::cmsutil::DynamicDestinationResolver` (p. 1879).

6.327.3.3 `virtual cms::Destination* activemq::cmsutil::DestinationResolver::resolveDestinationName`
`(cms::Session * session, const std::string & destName, bool pubSubDomain)`
`throw (cms::CMSException)` `[pure virtual]`

Resolves the given name to a destination.

If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters

<i>session</i>	the session for which to retrieve resolve the destination.
<i>destName</i>	the name to be resolved.
<i>pubSubDomain</i>	If true, the name will be resolved to a Topic, otherwise a Queue.

Returns

the resolved destination

Exceptions

<i>cms::CMSException</i> (p. 1190)	if resolution failed.
---------------------------------------	-----------------------

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1880).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**DestinationResolver.h**

6.328 activemq::commands::DiscoveryEvent Class Reference

```
#include <src/main/activemq/commands/DiscoveryEvent.h>
```

Inheritance diagram for activemq::commands::DiscoveryEvent:

Public Member Functions

- **DiscoveryEvent** ()
- virtual **~DiscoveryEvent** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DiscoveryEvent * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual const std::string & **getServiceName** () const
- virtual std::string & **getServiceName** ()
- virtual void **setServiceName** (const std::string &serviceName)
- virtual const std::string & **getBrokerName** () const
- virtual std::string & **getBrokerName** ()
- virtual void **setBrokerName** (const std::string &brokerName)

Static Public Attributes

- static const unsigned char **ID_DISCOVERYEVENT** = 40

Protected Attributes

- std::string **serviceName**
- std::string **brokerName**

6.328.1 Constructor & Destructor Documentation

6.328.1.1 `activemq::commands::DiscoveryEvent::DiscoveryEvent ()`

6.328.1.2 `virtual activemq::commands::DiscoveryEvent::~~DiscoveryEvent ()` [virtual]

6.328.2 Member Function Documentation

6.328.2.1 `virtual DiscoveryEvent* activemq::commands::DiscoveryEvent::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.328.2.2 `virtual void activemq::commands::DiscoveryEvent::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Implements `activemq::commands::DataStructure` (p. 1715).

6.328.2.3 `virtual bool activemq::commands::DiscoveryEvent::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

6.328.2.4 **virtual const std::string& activemq::commands::DiscoveryEvent::getBrokerName ()**
const [virtual]

6.328.2.5 **virtual std::string& activemq::commands::DiscoveryEvent::getBrokerName ()**
 [virtual]

6.328.2.6 **virtual unsigned char activemq::commands::DiscoveryEvent::getDataStructureType ()**
const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

6.328.2.7 **virtual std::string& activemq::commands::DiscoveryEvent::getServiceName ()**
 [virtual]

6.328.2.8 **virtual const std::string& activemq::commands::DiscoveryEvent::getServiceName ()**
const [virtual]

6.328.2.9 **virtual void activemq::commands::DiscoveryEvent::setBrokerName (const std::string & brokerName)** [virtual]

6.328.2.10 **virtual void activemq::commands::DiscoveryEvent::setServiceName (const std::string & serviceName)** [virtual]

6.328.2.11 **virtual std::string activemq::commands::DiscoveryEvent::toString ()** **const**
 [virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

6.328.3 Field Documentation

6.328.3.1 **std::string activemq::commands::DiscoveryEvent::brokerName**
[protected]

6.328.3.2 **const unsigned char activemq::commands::DiscoveryEvent::ID_-
DISCOVERYEVENT = 40** [static]

6.328.3.3 **std::string activemq::commands::DiscoveryEvent::serviceName**
[protected]

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs)**
throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs)** **throw (decaf::io::IOException)**
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.329.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1815).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.329.2 Constructor & Destructor Documentation

- 6.329.2.1 **activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::DiscoveryEventMarshaller**
 () [inline]
- 6.329.2.2 **virtual activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::~~DiscoveryEventMarshaller**
 () [inline, virtual]

6.329.3 Member Function Documentation

- 6.329.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

- 6.329.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::getDataStructureType**
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.329.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.329.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.329.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
`[virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1690).

6.329.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
`[virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1698).

6.330 activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller

Class Reference

1821

6.329.3.7 virtual void activemq::wireformat::openwire::marshal::v6::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/**DiscoveryEventMarshaller.h**

[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.330.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.331 activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller

Class Reference

1825

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.330.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.331.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.331.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.332 activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller

Class Reference

1829

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.331.3.7 virtual void **activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.332.3.4 virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::looseUnmarshal
 (OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataInputStream * dataIn) throw (
 decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.332.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.332.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.333 activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller

Class Reference

1833

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.332.3.7 virtual void **activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**DiscoveryEventMarshaller.h**

6.333 activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller

Class Reference

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1831).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/DiscoveryEventMarshaller
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller**:

Public Member Functions

- **DiscoveryEventMarshaller** ()
- virtual ~**DiscoveryEventMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.333.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1831).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.333.2 Constructor & Destructor Documentation

- 6.333.2.1 **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::DiscoveryEventMarshaller**
() [inline]
- 6.333.2.2 **virtual activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::~~DiscoveryEventMarshaller**
() [inline, virtual]

6.333.3 Member Function Documentation

- 6.333.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.333.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.333.3.3 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.333.3.4 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.333.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.333.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.334 activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller

Class Reference

1837

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

6.333.3.7 virtual void **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

() [inline]
- 6.334.2.2 **virtual activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::~~DiscoveryEventMarshaller**
() [inline, virtual]

6.334.3 Member Function Documentation

- 6.334.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.334.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.334.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

6.334.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.334.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

6.334.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)`
[virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.334.3.7 virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
  * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/DiscoveryEventMarshaller.h

6.335 activemq::core::DispatchData Class Reference

Simple POCO that contains the information necessary to route a message to a specified consumer.

```
#include <src/main/activemq/core/DispatchData.h>
```

Public Member Functions

- **DispatchData** ()
- **DispatchData** (const decaf::lang::Pointer< commands::ConsumerId > &consumer, const decaf::lang::Pointer< commands::Message > &message)
- const decaf::lang::Pointer< commands::ConsumerId > & getConsumerId ()
- const decaf::lang::Pointer< commands::Message > & getMessage ()

6.335.1 Detailed Description

Simple POCO that contains the information necessary to route a message to a specified consumer.

6.335.2 Constructor & Destructor Documentation

6.335.2.1 `activemq::core::DispatchData::DispatchData ()` `[inline]`

6.335.2.2 `activemq::core::DispatchData::DispatchData (const decaf::lang::Pointer< commands::ConsumerId > & consumer, const decaf::lang::Pointer< commands::Message > & message)` `[inline]`

6.335.3 Member Function Documentation

6.335.3.1 `const decaf::lang::Pointer< commands::ConsumerId > & activemq::core::DispatchData::getConsumerId ()` `[inline]`

6.335.3.2 `const decaf::lang::Pointer< commands::Message > & activemq::core::DispatchData::getMessage ()` `[inline]`

The documentation for this class was generated from the following file:

- `src/main/activemq/core/DispatchData.h`

6.336 `activemq::core::Dispatcher` Class Reference

Interface for an object responsible for dispatching messages to consumers.

```
#include <src/main/activemq/core/Dispatcher.h>
```

Inheritance diagram for `activemq::core::Dispatcher`:

Public Member Functions

- `virtual ~Dispatcher ()`
- `virtual void dispatch (const Pointer< MessageDispatch > &message)=0`

Dispatches a message to a particular consumer.

6.336.1 Detailed Description

Interface for an object responsible for dispatching messages to consumers.

6.336.2 Constructor & Destructor Documentation

6.336.2.1 virtual activemq::core::Dispatcher::~~Dispatcher () [inline, virtual]

6.336.3 Member Function Documentation

6.336.3.1 virtual void activemq::core::Dispatcher::dispatch (const Pointer< MessageDispatch > & message) [pure virtual]

Dispatches a message to a particular consumer.

Parameters

<i>message</i>	- the message to be dispatched.
----------------	---------------------------------

Implemented in **activemq::core::ActiveMQConsumer** (p. 305), and **activemq::core::ActiveMQSession** (p. 525).

The documentation for this class was generated from the following file:

- src/main/activemq/core/Dispatcher.h

6.337 decaf::lang::Double Class Reference

```
#include <src/main/decaf/lang/Double.h>
```

Inheritance diagram for decaf::lang::Double:

Public Member Functions

- **Double** (double value)
- **Double** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Double** ()
- virtual int **compareTo** (const **Double** &d) const
*Compares this **Double** (p. 1841) instance with another.*
- bool **equals** (const **Double** &d) const
- virtual bool **operator==** (const **Double** &d) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Double** &d) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const double &d) const
*Compares this **Double** (p. 1841) instance with another.*
- bool **equals** (const double &d) const
- virtual bool **operator==** (const double &d) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const double &d) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.
- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (double d1, double d2)
Compares the two specified double values.
- static long long **doubleToLongBits** (double value)
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.
- static long long **doubleToRawLongBits** (double value)
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.

- static bool **isInfinite** (double value)
- static bool **isNaN** (double value)
- static double **longBitsToDouble** (long long bits)
Returns the double value corresponding to a given bit representation.
- static double **parseDouble** (const std::string value) throw (exceptions::NumberFormatException)
*Returns a new double initialized to the value represented by the specified string, as performed by the valueOf method of class **Double** (p. 1841).*
- static std::string **toHexString** (double value)
Returns a hexadecimal string representation of the double argument.
- static std::string **toString** (double value)
Returns a string representation of the double argument.
- static **Double valueOf** (double value)
*Returns a **Double** (p. 1841) instance representing the specified double value.*
- static **Double valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Double** (p. 1841) instance that wraps a primitive double which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE** = 64
The size in bits of the primitive int type.
- static const double **MAX_VALUE**
The maximum value that the primitive type can hold.
- static const double **MIN_VALUE**
The minimum value that the primitive type can hold.
- static const double **NaN**
*Constant for the Not a **Number** (p. 2918) Value.*
- static const double **POSITIVE_INFINITY**
Constant for Positive Infinity.
- static const double **NEGATIVE_INFINITY**
Constant for Negative Infinity.

6.337.1 Constructor & Destructor Documentation

6.337.1.1 `decaf::lang::Double::Double (double value)`

Parameters

<i>value</i>	- the primitive type to wrap
--------------	------------------------------

6.337.1.2 `decaf::lang::Double::Double (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters

<i>value</i>	- the string to convert to a primitive type to wrap
--------------	---

6.337.1.3 `virtual decaf::lang::Double::~~Double () [inline, virtual]`

6.337.2 Member Function Documentation

6.337.2.1 `virtual unsigned char decaf::lang::Double::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2919).

6.337.2.2 `static int decaf::lang::Double::compare (double d1, double d2) [static]`

Compares the two specified double values.

The sign of the integer value returned is the same as that of the integer that would be returned by the call: `new Double(d1).compareTo(new Double(d2))`

Parameters

<i>d1</i>	- the first double to compare
<i>d2</i>	- the second double to compare

Returns

the value 0 if *d1* is numerically equal to *d2*; a value less than 0 if *d1* is numerically less than *d2*; and a value greater than 0 if *d1* is numerically greater than *d2*.

6.337.2.3 `virtual int decaf::lang::Double::compareTo (const double & d) const`
[virtual]

Compares this **Double** (p. 1841) instance with another.

Parameters

<i>d</i>	- the Double (p. 1841) instance to be compared
----------	---

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **double** > (p. 1249).

6.337.2.4 `virtual int decaf::lang::Double::compareTo (const Double & d) const`
[virtual]

Compares this **Double** (p. 1841) instance with another.

Parameters

<i>d</i>	- the Double (p. 1841) instance to be compared
----------	---

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Double** > (p. 1249).

6.337.2.5 `static long long decaf::lang::Double::doubleToLongBits (double value)`
[static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.

Bit 63 (the bit that is selected by the mask 0x8000000000000000L) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000L. If the argument is negative infinity, the result is 0xfff0000000000000L. If the argument is NaN, the result is 0x7ff8000000000000L.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long)

method, will produce a floating-point value the same as the argument to `doubleToLongBits` (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters

<i>value</i>	- double to be converted
--------------	--------------------------

Returns

the long long bits that make up the double

6.337.2.6 `static long long decaf::lang::Double::doubleToRawLongBits (double value)`
`[static]`

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.

Bit 63 (the bit that is selected by the mask `0x8000000000000000LL`) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask `0x7ff0000000000000L`) represent the exponent. Bits 51-0 (the bits that are selected by the mask `0x000ffffffffffffL`) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is `0x7ff0000000000000LL`. If the argument is negative infinity, the result is `0xfff0000000000000LL`. If the argument is NaN, the result is the long integer representing the actual NaN value. Unlike the `doubleToLongBits` method, `doubleToRawLongBits` does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is a long integer that, when given to the `longBitsToDouble(long)` method, will produce a floating-point value the same as the argument to `doubleToRawLongBits`.

Parameters

<i>value</i>	- double to be converted
--------------	--------------------------

Returns

the long long bits that make up the double

6.337.2.7 `virtual double decaf::lang::Double::doubleValue () const` `[inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2919).

6.337.2.8 `bool decaf::lang::Double::equals (const Double & d) const` `[inline, virtual]`

Parameters

<code>d</code>	- the Double (p. 1841) object to compare against.
----------------	--

Returns

true if the two **Double** (p. 1841) Objects have the same value.

Implements **decaf::lang::Comparable**< **Double** > (p. 1250).

6.337.2.9 `bool decaf::lang::Double::equals (const double & d) const` `[inline, virtual]`

Parameters

<code>d</code>	- the Double (p. 1841) object to compare against.
----------------	--

Returns

true if the two **Double** (p. 1841) Objects have the same value.

Implements **decaf::lang::Comparable**< **double** > (p. 1250).

6.337.2.10 `virtual float decaf::lang::Double::floatValue () const` `[inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.337.2.11 `virtual int decaf::lang::Double::intValue () const` `[inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.337.2.12 `bool decaf::lang::Double::isInfinite () const`

Returns

true if the double is equal to positive infinity.

6.337.2.13 `static bool decaf::lang::Double::isInfinite (double value) [static]`

Parameters

<i>value</i>	- The double to check.
--------------	------------------------

Returns

true if the double is equal to infinity.

6.337.2.14 `bool decaf::lang::Double::isNaN () const`

Returns

true if the double is equal to NaN.

6.337.2.15 `static bool decaf::lang::Double::isNaN (double value) [static]`

Parameters

<i>value</i>	- The double to check.
--------------	------------------------

Returns

true if the double is equal to NaN.

6.337.2.16 `static double decaf::lang::Double::longBitsToDouble (long long bits) [static]`

Returns the double value corresponding to a given bit representation.

The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "double format" bit layout.

If the argument is 0x7ff0000000000000L, the result is positive infinity. If the argument is 0xfff0000000000000L, the result is negative infinity. If the argument is any value in the range 0x7ff0000000000001L through 0x7fffffffffffffffL or in the range 0xfff0000000000001L through 0xfffffffffffffffL, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Double.doubleToRawLongBits** (p. 1846) method.

Parameters

<i>bits</i>	- the long long bits to convert to double
-------------	---

Returns

the double converted from the bits

6.337.2.17 `virtual long long decaf::lang::Double::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

6.337.2.18 `virtual bool decaf::lang::Double::operator< (const Double & d) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>d</i> - the value to be compared to this one.
--

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Double >** (p. 1250).

6.337.2.19 `virtual bool decaf::lang::Double::operator< (const double & d) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>d</i> - the value to be compared to this one.
--

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< double >** (p. 1250).

6.337.2.20 `virtual bool decaf::lang::Double::operator== (const Double & d) const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters

<i>d</i>	- the value to be compared to this one.
----------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Double** > (p. 1250).

6.337.2.21 `virtual bool decaf::lang::Double::operator== (const double & d) const`
`[inline, virtual]`

Compares equality between this object and the one passed.

Parameters

<i>d</i>	- the value to be compared to this one.
----------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **double** > (p. 1250).

6.337.2.22 `static double decaf::lang::Double::parseDouble (const std::string value) throw (`
`exceptions::NumberFormatException)` `[static]`

Returns a new double initialized to the value represented by the specified string, as performed by the `valueOf` method of class **Double** (p. 1841).

Parameters

<i>value</i>	- The string to parse to an double
--------------	------------------------------------

Returns

a double parsed from the passed string

Exceptions

<i>NumberFormatException</i>	
------------------------------	--

6.337.2.23 `virtual short decaf::lang::Double::shortValue () const` `[inline,`
`virtual]`

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2920).

6.337.2.24 static std::string decaf::lang::Double::toHexString (double value) [static]

Returns a hexadecimal string representation of the double argument.

All characters mentioned below are ASCII characters.

* If the argument is NaN, the result is the string "NaN". * Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a double value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 2157) on the exponent value. o If m is a double value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters

<i>value</i>	- The double to convert to a string
--------------	-------------------------------------

Returns

the Hex formatted double string.

6.337.2.25 std::string decaf::lang::Double::toString () const**Returns**

this **Double** (p. 1841) Object as a **String** (p. 3775) Representation

6.337.2.26 static std::string decaf::lang::Double::toString (double value) [static]

Returns a string representation of the double argument.

All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m:

- o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity".
- o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0".
- o If m is greater than or equal to 10⁻³ but less than 10⁷, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m.
- o If m is less than 10⁻³ or greater than or equal to 10⁷, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10ⁿ ≤ m < 10ⁿ⁺¹; then let a be the mathematically exact quotient of m and 10ⁿ so that 1 ≤ a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 2158).

Parameters

<i>value</i>	- The double to convert to a string
--------------	-------------------------------------

Returns

the formatted double string.

6.337.2.27 `static Double decaf::lang::Double::valueOf (double value) [static]`

Returns a **Double** (p. 1841) instance representing the specified double value.

Parameters

<i>value</i>	- double to wrap
--------------	------------------

Returns

new **Double** (p. 1841) instance wrapping the primitive value

6.337.2.28 `static Double decaf::lang::Double::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]`

Returns a **Double** (p. 1841) instance that wraps a primitive double which is parsed from the string value passed.

Parameters

<i>value</i>	- the string to parse
--------------	-----------------------

Returns

a new **Double** (p. 1841) instance wrapping the double parsed from value

Exceptions

<i>NumberFormatException</i>	on error.
------------------------------	-----------

6.337.3 Field Documentation**6.337.3.1** `const double decaf::lang::Double::MAX_VALUE` [static]

The maximum value that the primitive type can hold.

6.337.3.2 `const double decaf::lang::Double::MIN_VALUE` [static]

The minimum value that the primitive type can hold.

6.337.3.3 `const double decaf::lang::Double::NaN` [static]

Constant for the Not a **Number** (p. 2918) Value.

6.337.3.4 `const double decaf::lang::Double::NEGATIVE_INFINITY` [static]

Constant for Negative Infinity.

6.337.3.5 `const double decaf::lang::Double::POSITIVE_INFINITY` [static]

Constant for Positive Infinity.

6.337.3.6 `const int decaf::lang::Double::SIZE = 64` [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Double.h**

6.338 decaf::internal::nio::DoubleArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/DoubleArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::DoubleArrayBuffer:

Public Member Functions

- **DoubleArrayBuffer** (int capacity, bool readOnly=false) throw (decaf::lang::exceptions::IllegalArgumentException)

*Creates a **DoubleArrayBuffer** (p. 1853) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **DoubleArrayBuffer** (double *array, int size, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

*Creates a **DoubleArrayBuffer** (p. 1853) object that wraps the given array.*

- **DoubleArrayBuffer** (const decaf::lang::Pointer< ByteArrayAdapter > &array, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **DoubleArrayBuffer** (const **DoubleArrayBuffer** &other)

*Create a **DoubleArrayBuffer** (p. 1853) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**DoubleArrayBuffer** ()
- virtual double * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

*the array that backs this **Buffer** (p. 936).*

Exceptions

ReadOnlyBufferException (p. 3260)	<i>if this Buffer (p. 936) is read only.</i>
UnsupportedOperationException	<i>if the underlying store has no array.</i>

- virtual int **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 3260)	if this <i>Buffer</i> (p. 936) is read only.
UnsupportedOperationException	if the underlying store has no array.

- virtual *DoubleBuffer* * **asReadOnlyBuffer** () const

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only double buffer which the caller then owns.

- virtual *DoubleBuffer* & **compact** () throw (decaf::nio::ReadOnlyBufferException)

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

*a reference to this **DoubleBuffer** (p. 1865).*

Exceptions

ReadOnlyBufferException (p. 3260)	if this buffer is read-only.
---	------------------------------

- virtual *DoubleBuffer* * **duplicate** ()

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new double **Buffer** (p. 936) which the caller owns.*

- virtual double **get** () throw (decaf::nio::BufferUnderflowException)

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position.

Exceptions

BufferUnderflowException (p. 967)	if there no more data to return.
---	----------------------------------

- virtual double **get** (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the Buffer (p. 936) where the double is to be read.
-------	---

Returns

the double that is located at the given index.

Exceptions

IndexOutOfBoundsException	if index is not smaller than the buffer's limit
----------------------------------	---

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () const

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

- virtual DoubleBuffer & **put** (double value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value	The doubles value to be written.
-------	----------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	<i>if this buffer's current position is not smaller than its limit.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual DoubleBuffer & **put** (int index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes the given doubles into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 936) to write the data.</i>
value	<i>The doubles to write.</i>

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or the index is negative.</i>
ReadOnlyBufferException (p. 3260)	<i>if this buffer is read-only.</i>

- virtual DoubleBuffer * **slice** () const

*Creates a new **DoubleBuffer** (p. 1865) whose content is a shared subsequence of this buffer's content.*

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the newly create **DoubleBuffer** (p. 1865) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

*Sets this **DoubleArrayBuffer** (p. 1853) as Read-Only or not Read-Only.*

6.338.1 Constructor & Destructor Documentation

6.338.1.1 `decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer`
 (`int capacity`, `bool readOnly = false`) `throw (`
`decaf::lang::exceptions::IllegalArgumentException` `)`

Creates a **DoubleArrayBuffer** (p. 1853) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>size</i>	The size of the array, this is the limit we read and write to.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>IllegalArgumentException</i>	if the capacity value is negative.
---------------------------------	------------------------------------

6.338.1.2 `decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (` `double`
`* array`, `int size`, `int offset`, `int length`, `bool readOnly = false`
`) throw (` `decaf::lang::exceptions::NullPointerException`,
`decaf::lang::exceptions::IndexOutOfBoundsException` `)`

Creates a **DoubleArrayBuffer** (p. 1853) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The actual array to wrap.
<i>size</i>	The size of the given array.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if offset is greater than array capacity.

```
6.338.1.3 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer
( const decaf::lang::Pointer< ByteArrayAdapter >
& array, int offset, int length, bool readOnly = false )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IndexOutOfBoundsException )
```

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **DoubleArrayBuffer** (p. 1853) will be that of the remaining capacity of the passed buffer.

Parameters

<i>array</i>	The ByteArrayAdapter to wrap.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if array is NULL
<i>IndexOutOfBoundsException</i>	if offset + length is greater than array size.

```
6.338.1.4 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer ( const
DoubleArrayBuffer & other )
```

Create a **DoubleArrayBuffer** (p. 1853) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters

<i>other</i>	The DoubleArrayBuffer (p. 1853) this one is to mirror.
--------------	---

```
6.338.1.5 virtual decaf::internal::nio::DoubleArrayBuffer::~~DoubleArrayBuffer ( )
[virtual]
```

6.338.2 Member Function Documentation

```
6.338.2.1 virtual double* decaf::internal::nio::DoubleArrayBuffer::array ( ) throw
( decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException ) [virtual]
```

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 936).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this Buffer (p. 936) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1868).

6.338.2.2 `virtual int decaf::internal::nio::DoubleArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this Buffer (p. 936) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1869).

6.338.2.3 `virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::asReadOnlyBuffer () const` [virtual]

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and

will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only double buffer which the caller then owns.

Implements **decaf::nio::DoubleBuffer** (p. 1869).

6.338.2.4 `virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException)` [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **DoubleBuffer** (p. 1865).

Exceptions

ReadOnlyBufferException (p. 3260)	if this buffer is read-only.
---	------------------------------

Implements **decaf::nio::DoubleBuffer** (p. 1870).

6.338.2.5 `virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::duplicate ()` [virtual]

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new double **Buffer** (p. 936) which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1870).

6.338.2.6 virtual double decaf::internal::nio::DoubleArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there no more data to return.
---	----------------------------------

Implements **decaf::nio::DoubleBuffer** (p. 1872).

6.338.2.7 virtual double decaf::internal::nio::DoubleArrayBuffer::get (int *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the double is to be read.
--------------	---

Returns

the double that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit
----------------------------------	---

Implements **decaf::nio::DoubleBuffer** (p. 1871).

6.338.2.8 `virtual bool decaf::internal::nio::DoubleArrayBuffer::hasArray () const`
`[inline, virtual]`

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::DoubleBuffer** (p. 1873).

6.338.2.9 `virtual bool decaf::internal::nio::DoubleArrayBuffer::isReadOnly () const`
`[inline, virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 940).

6.338.2.10 `virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (int index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)` `[virtual]`

Writes the given doubles into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The doubles to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or the index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 1874).

6.338.2.11 `virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (double value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)` [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The doubles value to be written.
--------------	----------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not smaller than its limit.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 1873).

6.338.2.12 `virtual void decaf::internal::nio::DoubleArrayBuffer::setReadOnly (bool value)`
[inline, protected, virtual]

Sets this **DoubleArrayBuffer** (p. 1853) as Read-Only or not Read-Only.

Parameters

<i>value</i>	Boolean value, true if this buffer is to be read-only, false otherwise.
--------------	---

6.338.2.13 `virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::slice () const`
[virtual]

Creates a new **DoubleBuffer** (p. 1865) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **DoubleBuffer** (p. 1865) which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1876).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**DoubleArrayBuffer.h**

6.339 decaf::nio::DoubleBuffer Class Reference

This class defines four categories of operations upon double buffers:

```
#include <src/main/decaf/nio/DoubleBuffer.h>
```

Inheritance diagram for decaf::nio::DoubleBuffer:

Public Member Functions

- virtual **~DoubleBuffer** ()
- virtual std::string **toString** () const
- virtual double * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the double array that backs this buffer (optional operation).
- virtual int **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **DoubleBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only double buffer that shares this buffer's content.
- virtual **DoubleBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **DoubleBuffer** * **duplicate** ()=0
Creates a new double buffer that shares this buffer's content.
- virtual double **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual double **get** (int index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.

- **DoubleBuffer & get** (std::vector< double > buffer) throw (BufferUnderflowException)

Relative bulk get method.

- **DoubleBuffer & get** (double *buffer, int size, int offset, int length) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Relative bulk get method.

- virtual bool **hasArray** () const =0

Tells whether or not this buffer is backed by an accessible double array.

- **DoubleBuffer & put** (**DoubleBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException)

This method transfers the doubles remaining in the given source buffer into this buffer.

- **DoubleBuffer & put** (const double *buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

This method transfers doubles into this buffer from the given source array.

- **DoubleBuffer & put** (std::vector< double > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source doubles array into this buffer.

- virtual **DoubleBuffer & put** (double value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual **DoubleBuffer & put** (int index, double value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given doubles into this buffer at the given index.

- virtual **DoubleBuffer * slice** () const =0

*Creates a new **DoubleBuffer** (p. 1865) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **DoubleBuffer** &value) const

- virtual bool **equals** (const **DoubleBuffer** &value) const

- virtual bool **operator==** (const **DoubleBuffer** &value) const
- virtual bool **operator<** (const **DoubleBuffer** &value) const

Static Public Member Functions

- static **DoubleBuffer** * **allocate** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)
*Allocates a new **DoubleBuffer** (p. 1865).*
- static **DoubleBuffer** * **wrap** (double *array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Wraps the passed buffer with a new **DoubleBuffer** (p. 1865).*
- static **DoubleBuffer** * **wrap** (std::vector< double > &buffer)
*Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1865).*

Protected Member Functions

- **DoubleBuffer** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **DoubleBuffer** (p. 1865) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.339.1 Detailed Description

This class defines four categories of operations upon double buffers: o Absolute and relative get and put methods that read and write single doubles; o Relative bulk get methods that transfer contiguous sequences of doubles from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of doubles from a double array or some other double buffer into this buffer o Methods for compacting, duplicating, and slicing a double buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing double array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

Since

1.0

6.339.2 Constructor & Destructor Documentation

6.339.2.1 `decaf::nio::DoubleBuffer::DoubleBuffer (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)` [protected]

Creates a **DoubleBuffer** (p. 1865) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size and limit of the Buffer (p. 936) in doubles
-----------------	---

Exceptions

<i>IllegalArgumentException</i>	if capacity is negative.
---------------------------------	--------------------------

6.339.2.2 `virtual decaf::nio::DoubleBuffer::~~DoubleBuffer ()` [inline, virtual]

6.339.3 Member Function Documentation

6.339.3.1 `static DoubleBuffer* decaf::nio::DoubleBuffer::allocate (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)` [static]

Allocates a new **DoubleBuffer** (p. 1865).

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

<i>capacity</i>	The size of the Double buffer in doubles.
-----------------	---

Returns

the **DoubleBuffer** (p. 1865) that was allocated, caller owns.

Exceptions

<i>IllegalArgumentException</i>	is the capacity value is negative.
---------------------------------	------------------------------------

6.339.3.2 `virtual double* decaf::nio::DoubleBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)` [pure virtual]

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 936).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this Buffer (p. 936) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1859).

6.339.3.3 `virtual int decaf::nio::DoubleBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)` [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this Buffer (p. 936) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1860).

6.339.3.4 `virtual DoubleBuffer* decaf::nio::DoubleBuffer::asReadOnlyBuffer () const` [pure virtual]

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and

will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only double buffer which the caller then owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1860).

6.339.3.5 `virtual DoubleBuffer& decaf::nio::DoubleBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]`

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 941) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 940) - 1 is copied to index $n = \text{limit}()$ (p. 940) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **DoubleBuffer** (p. 1865).

Exceptions

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.
--	------------------------------

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1861).

6.339.3.6 `virtual int decaf::nio::DoubleBuffer::compareTo (const DoubleBuffer & value) const [virtual]`

6.339.3.7 `virtual DoubleBuffer* decaf::nio::DoubleBuffer::duplicate () [pure virtual]`

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content

will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new double **Buffer** (p. 936) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1861).

6.339.3.8 `virtual bool decaf::nio::DoubleBuffer::equals (const DoubleBuffer & value) const`
[virtual]

6.339.3.9 `DoubleBuffer& decaf::nio::DoubleBuffer::get (std::vector< double > buffer)`
`throw (BufferUnderflowException)`

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 936).

Exceptions

<i>BufferUnderflowException</i> (p. 967)	iIf there are fewer than length doubles remaining in this buffer
--	--

6.339.3.10 `virtual double decaf::nio::DoubleBuffer::get (int index) const throw (`
`lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 936) where the double is to be read.
--------------	---

Returns

the double that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit
----------------------------------	---

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1862).

6.339.3.11 DoubleBuffer& decaf::nio::DoubleBuffer::get (double * *buffer*, int *size*, int *offset*, int *length*) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Relative bulk get method.

This method transfers doubles from this buffer into the given destination array. If there are fewer doubles remaining in the buffer than are required to satisfy the request, that is, if *length* > **remaining()** (p. 941), then no bytes are transferred and a **BufferUnderflowException** (p. 967) is thrown.

Otherwise, this method copies *length* doubles from this buffer into the given array, starting at the current position of this buffer and at the given *offset* in the array. The position of this buffer is then incremented by *length*.

Parameters

<i>buffer</i>	The pointer to an allocated buffer to fill.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 936).

Exceptions

BufferUnderflowException (p. 967)	if there are fewer than <i>length</i> doubles remaining in this buffer
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of <i>size</i> , <i>offset</i> , or <i>length</i> are not met.

6.339.3.12 virtual double decaf::nio::DoubleBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position.

Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there no more data to return.
--	----------------------------------

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1862).

6.339.3.13 `virtual bool decaf::nio::DoubleBuffer::hasArray () const` [pure virtual]

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1863).

6.339.3.14 `virtual bool decaf::nio::DoubleBuffer::operator< (const DoubleBuffer & value) const` [virtual]

6.339.3.15 `virtual bool decaf::nio::DoubleBuffer::operator== (const DoubleBuffer & value) const` [virtual]

6.339.3.16 `virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (double value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The doubles value to be written.
--------------	----------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if this buffer's current position is not smaller than its limit.
---	--

<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.
--	------------------------------

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1864).

6.339.3.17 **virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (int *index*, double *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)** [pure virtual]

Writes the given doubles into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 936) to write the data.
<i>value</i>	The doubles to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or the index is negative.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1863).

6.339.3.18 **DoubleBuffer& decaf::nio::DoubleBuffer::put (const double * *buffer*, int *size*, int *offset*, int *length*) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)**

This method transfers doubles into this buffer from the given source array.

If there are more doubles to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 941), then no doubles are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given `offset` in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

<i>buffer</i>	The array from which doubles are to be read.
---------------	--

<i>size</i>	The size of the buffer passed.
<i>offset</i>	The offset within the array of the first char to be read.
<i>length</i>	The number of doubles to be read from the given array.

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there is insufficient space in this buffer
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.339.3.19 DoubleBuffer& decaf::nio::DoubleBuffer::put (std::vector< double > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source doubles array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size()).

Parameters

<i>buffer</i>	The buffer whose contents are copied to this DoubleBuffer (p. 1865).
---------------	---

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 964)	if there is insufficient space in this buffer.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

6.339.3.20 **DoubleBuffer& decaf::nio::DoubleBuffer::put (DoubleBuffer & src)**
throw (BufferOverflowException, ReadOnlyBufferException,
decaf::lang::exceptions::IllegalArgumentException)

This method transfers the doubles remaining in the given source buffer into this buffer.

If there are more doubles remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 941), then no doubles are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies `n = src.remaining()` doubles from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

<i>src</i>	The buffer to take doubles from an place in this one.
------------	---

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 964)	if there is insufficient space in this buffer for the remaining doubles in the source buffer
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException (p. 3260)	if this buffer is read-only.

6.339.3.21 **virtual DoubleBuffer* decaf::nio::DoubleBuffer::slice () const** [pure virtual]

Creates a new **DoubleBuffer** (p. 1865) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **DoubleBuffer** (p. 1865) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1864).

6.339.3.22 `virtual std::string decaf::nio::DoubleBuffer::toString () const` `[virtual]`

Returns

a std::string describing this object

6.339.3.23 `static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (double * array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)` `[static]`

Wraps the passed buffer with a new **DoubleBuffer** (p. 1865).

The new buffer will be backed by the given double array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>array</i>	The array that will back the new buffer.
<i>size</i>	The size of the passed in array.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new **DoubleBuffer** (p. 1865) that is backed by buffer, caller owns.

Exceptions

<i>NullPointerException</i>	if the array pointer is NULL.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.339.3.24 `static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (std::vector< double > & buffer)` `[static]`

Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1865).

The new buffer will be backed by the given double array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new **DoubleBuffer** (p. 1865) that is backed by buffer, caller owns.

6.341 activemq::cmsutil::DynamicDestinationResolver Class Reference

Resolves a CMS destination name to a *Destination*.

```
#include <src/main/activemq/cmsutil/DynamicDestinationResolver.h>
```

Inheritance diagram for activemq::cmsutil::DynamicDestinationResolver:

Data Structures

- class **SessionResolver**
Manages maps of names to topics and queues for a single session.

Public Member Functions

- **DynamicDestinationResolver ()**
- virtual **~DynamicDestinationResolver ()**
- virtual void **init (ResourceLifecycleManager *mgr)**
Initializes this destination resolver for use.
- virtual void **destroy ()**
Destroys any allocated resources.
- virtual **cms::Destination * resolveDestinationName (cms::Session *session, const std::string &destName, bool pubSubDomain) throw (cms::CMSException)**

Resolves the given name to a destination.

Protected Member Functions

- **DynamicDestinationResolver** (const **DynamicDestinationResolver** &)
- **DynamicDestinationResolver** & **operator=** (const **DynamicDestinationResolver** &)

6.341.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.341.2 Constructor & Destructor Documentation

6.341.2.1 **activemq::cmsutil::DynamicDestinationResolver::DynamicDestinationResolver** (const **DynamicDestinationResolver** &) [inline, protected]

6.341.2.2 **activemq::cmsutil::DynamicDestinationResolver::DynamicDestinationResolver** ()

6.341.2.3 **virtual activemq::cmsutil::DynamicDestinationResolver::~~DynamicDestinationResolver** () [virtual]

6.341.3 Member Function Documentation

6.341.3.1 **virtual void activemq::cmsutil::DynamicDestinationResolver::destroy** () [virtual]

Destroys any allocated resources.

Implements **activemq::cmsutil::DestinationResolver** (p. 1811).

6.341.3.2 **virtual void activemq::cmsutil::DynamicDestinationResolver::init** (**ResourceLifecycleManager** * *mgr*) [inline, virtual]

Initializes this destination resolver for use.

Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p. 1879)).

Parameters

<i>mgr</i>	the resource lifecycle manager.
------------	---------------------------------

Implements **activemq::cmsutil::DestinationResolver** (p. 1811).

6.341.3.3 `DynamicDestinationResolver& activemq::cmsutil::DynamicDestinationResolver::operator= (const DynamicDestinationResolver &)` `[inline, protected]`

6.341.3.4 `virtual cms::Destination* activemq::cmsutil::DynamicDestinationResolver::resolveDestinationName (cms::Session * session, const std::string & destName, bool pubSubDomain)`
`throw (cms::CMSException)` `[virtual]`

Resolves the given name to a destination.

If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters

<i>session</i>	the session for which to retrieve resolve the destination.
<i>destName</i>	the name to be resolved.
<i>pubSubDomain</i>	If true, the name will be resolved to a Topic, otherwise a Queue.

Returns

the resolved destination

Exceptions

<i>cms::CMSException</i> (p. 1190)	if resolution failed.
---------------------------------------	-----------------------

Implements `activemq::cmsutil::DestinationResolver` (p. 1811).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/DynamicDestinationResolver.h`

6.343.1.1 decaf::io::EOFException::EOFException () throw () [inline]

Default Constructor.

6.343.1.2 decaf::io::EOFException::EOFException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.343.1.3 decaf::io::EOFException::EOFException (const EOFException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.343.1.4 `decaf::io::EOFException::EOFException (const char * file, const int lineNumber,
const std::exception * cause, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.343.1.5 `decaf::io::EOFException::EOFException (const std::exception * cause) throw ()`
`[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.343.1.6 `decaf::io::EOFException::EOFException (const char * file, const int lineNumber,
const char * msg, ...) throw ()` `[inline]`

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.343.1.7 `virtual decaf::io::EOFException::~EOFException () throw ()` `[inline, virtual]`

6.343.2 Member Function Documentation

6.343.2.1 `virtual EOFException* decaf::io::EOFException::clone () const` `[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 2212).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/EOFException.h`

6.344 decaf::util::logging::ErrorManager Class Reference

ErrorManager (p. 1884) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 2042) during Logging.

```
#include <src/main/decaf/util/logging/ErrorManager.h>
```

Public Member Functions

- **ErrorManager** ()
- virtual **~ErrorManager** ()
- virtual void **error** (const std::string &message, **decaf::lang::Exception** *ex, int code)

*The error method is called when a **Handler** (p. 2042) failure occurs.*

Static Public Attributes

- static const int **GENERIC_FAILURE**
GENERIC_FAILURE is used for failure that don't fit into one of the other categories.
- static const int **WRITE_FAILURE**
WRITE_FAILURE is used when a write to an output stream fails.
- static const int **FLUSH_FAILURE**
FLUSH_FAILURE is used when a flush to an output stream fails.
- static const int **CLOSE_FAILURE**
CLOSE_FAILURE is used when a close of an output stream fails.
- static const int **OPEN_FAILURE**
OPEN_FAILURE is used when an open of an output stream fails.

- static const int **FORMAT_FAILURE**

FORMAT_FAILURE is used when formatting fails for any reason.

6.344.1 Detailed Description

ErrorManager (p. 1884) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 2042) during Logging. When processing logging output, if a **Handler** (p. 2042) encounters problems then rather than throwing an Exception back to the issuer of the logging call (who is unlikely to be interested) the **Handler** (p. 2042) should call its associated **ErrorManager** (p. 1884).

Since

1.0

6.344.2 Constructor & Destructor Documentation

6.344.2.1 `decaf::util::logging::ErrorManager::ErrorManager ()`

6.344.2.2 `virtual decaf::util::logging::ErrorManager::~~ErrorManager ()` [virtual]

6.344.3 Member Function Documentation

6.344.3.1 `virtual void decaf::util::logging::ErrorManager::error (const std::string & message, decaf::lang::Exception * ex, int code)` [virtual]

The error method is called when a **Handler** (p. 2042) failure occurs.

This method may be overridden in subclasses. The default behavior in this base class is that the first call is reported to System.err, and subsequent calls are ignored.

Parameters

<i>msg</i>	- a descriptive string (may be empty)
<i>ex</i>	- an exception (may be NULL)
<i>code</i>	- an error code defined in ErrorManager (p. 1884)

6.344.4 Field Documentation

6.344.4.1 `const int decaf::util::logging::ErrorManager::CLOSE_FAILURE`
[static]

CLOSE_FAILURE is used when a close of an output stream fails.

6.344.4.2 `const int decaf::util::logging::ErrorManager::FLUSH_FAILURE`
[static]

FLUSH_FAILURE is used when a flush to an output stream fails.

6.344.4.3 `const int decaf::util::logging::ErrorManager::FORMAT_FAILURE`
[static]

FORMAT_FAILURE is used when formatting fails for any reason.

6.344.4.4 `const int decaf::util::logging::ErrorManager::GENERIC_FAILURE`
[static]

GENERIC_FAILURE is used for failure that don't fit into one of the other categories.

6.344.4.5 `const int decaf::util::logging::ErrorManager::OPEN_FAILURE`
[static]

OPEN_FAILURE is used when an open of an output stream fails.

6.344.4.6 `const int decaf::util::logging::ErrorManager::WRITE_FAILURE`
[static]

WRITE_FAILURE is used when a write to an output stream fails.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/ErrorManager.h`

6.345 decaf::lang::Exception Class Reference

```
#include <src/main/decaf/lang/Exception.h>
```

Inheritance diagram for decaf::lang::Exception:

Public Member Functions

- **Exception** () throw ()
Default Constructor.
- **Exception** (const **Exception** &ex) throw ()
Copy Constructor.

- **Exception** (const std::exception ***cause**) throw ()
Constructor.
- **Exception** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **Exception** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual ~**Exception** () throw ()
- virtual std::string **getMessage** () const
Gets the message for this exception.
- virtual const std::exception * **getCause** () const
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual void **initCause** (const std::exception ***cause**)
Initializes the contained cause exception with the one given.
- virtual const char * **what** () const throw ()
Implement method from std::exception.
- virtual void **setMessage** (const char *msg,...)
Sets the cause for this exception.
- virtual void **setMark** (const char *file, const int lineNumber)
Adds a file/line number to the stack trace.
- virtual **Exception** * **clone** () const
Clones this exception.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **printStackTrace** () const
Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) const
Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () const

Gets the stack trace as one contiguous string.

- **Exception & operator=** (const **Exception** &ex)

Assignment operator.

Protected Member Functions

- virtual void **setStackTrace** (const std::vector< std::pair< std::string, int > > &trace)
- virtual void **buildMessage** (const char *format, va_list &vargs)

Protected Attributes

- std::string **message**
The cause of this exception.
- std::exception * **cause**
*The **Exception** (p. 1886) that caused this one to be thrown.*
- std::vector< std::pair< std::string, int > > **stackTrace**
The stack trace.

6.345.1 Constructor & Destructor Documentation

6.345.1.1 decaf::lang::Exception::Exception () throw ()

Default Constructor.

6.345.1.2 decaf::lang::Exception::Exception (const **Exception** & ex) throw ()

Copy Constructor.

Parameters

<i>ex</i>	The Exception (p. 1886) instance to copy.
-----------	--

6.345.1.3 decaf::lang::Exception::Exception (const std::exception * *cause*) throw ()

Constructor.

Parameters

<i>cause</i>	Pointer (p. 3032) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	---

6.345.1.4 `decaf::lang::Exception::Exception (const char * file, const int lineNumber, const char * msg, ...) throw ()`

Constructor - Initializes the file name and line number where this message occurred.
Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.345.1.5 `decaf::lang::Exception::Exception (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()`

Constructor - Initializes the file name and line number where this message occurred.
Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.345.1.6 `virtual decaf::lang::Exception::~~Exception () throw ()` [virtual]

6.345.2 Member Function Documentation

6.345.2.1 `virtual void decaf::lang::Exception::buildMessage (const char * format, va_list & vargs)` [protected, virtual]

Referenced by `decaf::lang::exceptions::NumberFormatException::NumberFormatException()`.

6.345.2.2 `virtual Exception* decaf::lang::Exception::clone () const` [virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this **Exception** (p. 1886) object

Implements **decaf::lang::Throwable** (p. 3896).

Reimplemented in **activemq::exceptions::ActiveMQException** (p. 349), **activemq::exceptions::BrokerException** (p. 874), **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2958), **decaf::io::EOFException** (p. 1883), **decaf::io::InterruptedIOException** (p. 2198), **decaf::io::IOException** (p. 2212), **decaf::io::UnsupportedEncodingException** (p. 4027), **decaf::io::UTFDataFormatException** (p. 4080), **decaf::lang::exceptions::ClassCastException** (p. 1179), **decaf::lang::exceptions::IllegalArgumentException** (p. 2056), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 2059), **decaf::lang::exceptions::IllegalStateException** (p. 2062), **decaf::lang::exceptions::IllegalThreadStateException** (p. 2065), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 2072), **decaf::lang::exceptions::InterruptedException** (p. 2196), **decaf::lang::exceptions::InvalidStateException** (p. 2210), **decaf::lang::exceptions::NoSuchElementException** (p. 2912), **decaf::lang::exceptions::NullPointerException** (p. 2918), **decaf::lang::exceptions::NumberFormatException** (p. 2923), **decaf::lang::exceptions::RuntimeException** (p. 3423), **decaf::lang::exceptions::UnsupportedOperationException** (p. 4030), **decaf::net::BindException** (p. 844), **decaf::net::ConnectException** (p. 1296), **decaf::net::HttpRetryException** (p. 2051), **decaf::net::MalformedURLException** (p. 2538), **decaf::net::NoRouteToHostException** (p. 2907), **decaf::net::PortUnreachableException** (p. 3062), **decaf::net::ProtocolException** (p. 3230), **decaf::net::SocketException** (p. 3629), **decaf::net::SocketTimeoutException** (p. 3652), **decaf::net::UnknownHostException** (p. 4022), **decaf::net::UnknownServiceException** (p. 4024), **decaf::net::URISyntaxException** (p. 4063), **decaf::nio::BufferOverflowException** (p. 966), **decaf::nio::BufferUnderflowException** (p. 969), **decaf::nio::InvalidMarkException** (p. 2206), **decaf::nio::ReadOnlyBufferException** (p. 3263), **decaf::security::cert::CertificateEncodingException** (p. 1118), **decaf::security::cert::CertificateExpiredException** (p. 1120), **decaf::security::cert::CertificateExpiredException** (p. 1122), **decaf::security::cert::CertificateNotFoundException** (p. 1124), **decaf::security::cert::CertificateParsingException** (p. 1126), **decaf::security::GeneralSecurityException** (p. 2037), **decaf::security::InvalidKeyException** (p. 2203), **decaf::security::KeyException** (p. 2368), **decaf::security::KeyManagementException** (p. 2371), **decaf::security::NoSuchAlgorithmException** (p. 2910), **decaf::security::NoSuchProviderException** (p. 2915), **decaf::security::SignatureException** (p. 3604), **decaf::util::concurrent::BrokenBarrierException** (p. 868), **decaf::util::concurrent::CancellationException** (p. 1112), **decaf::util::concurrent::ExecutionException** (p. 1926), **decaf::util::concurrent::RejectedExecutionException** (p. 3282), **decaf::util::concurrent::TimeoutException** (p. 3901), **decaf::util::zip::DataFormatException** (p. 1602), and **decaf::util::zip::ZipException** (p. 4178).

6.345.2.3 `virtual const std::exception* decaf::lang::Exception::getCause () const`
`[inline, virtual]`

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implements **decaf::lang::Throwable** (p. 3897).

6.345.2.4 `virtual std::string decaf::lang::Exception::getMessage () const` `[inline, virtual]`

Gets the message for this exception.

Returns

Text formatted error message

Implements **decaf::lang::Throwable** (p. 3897).

Referenced by `activemq::exceptions::BrokerException::BrokerException()`.

6.345.2.5 `virtual std::vector< std::pair< std::string, int> > decaf::lang::Exception::getStackTrace () const` `[virtual]`

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

The first item in the returned vector is the first point where the mark was set (e.g. where the exception was created).

Returns

the stack trace.

Implements **decaf::lang::Throwable** (p. 3897).

6.345.2.6 `virtual std::string decaf::lang::Exception::getStackTraceString () const` `[virtual]`

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

Implements **decaf::lang::Throwable** (p. 3898).

6.345.2.7 `virtual void decaf::lang::Exception::initCause (const std::exception * cause)` `[virtual]`

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

Parameters

<i>cause</i>	The exception that was the cause of this one.
--------------	---

Implements **decaf::lang::Throwable** (p. 3898).

6.345.2.8 **Exception& decaf::lang::Exception::operator= (const Exception & ex)**

Assignment operator.

Parameters

<i>ex</i>	const reference to another Exception (p. 1886)
-----------	---

6.345.2.9 **virtual void decaf::lang::Exception::printStackTrace () const** [virtual]

Prints the stack trace to std::err.

Implements **decaf::lang::Throwable** (p. 3898).

6.345.2.10 **virtual void decaf::lang::Exception::printStackTrace (std::ostream & stream) const** [virtual]

Prints the stack trace to the given output stream.

Parameters

<i>stream</i>	the target output stream.
---------------	---------------------------

Implements **decaf::lang::Throwable** (p. 3898).

6.345.2.11 **virtual void decaf::lang::Exception::setMark (const char * file, const int lineNumber)** [virtual]

Adds a file/line number to the stack trace.

Parameters

<i>file</i>	The name of the file calling this method (use __FILE__).
<i>lineNumber</i>	The line number in the calling file (use __LINE__).

Implements **decaf::lang::Throwable** (p. 3899).

Referenced by decaf::lang::exceptions::NumberFormatException::NumberFormatException().

6.345.2.12 **virtual void decaf::lang::Exception::setMessage (const char * msg, ...)** [virtual]

Sets the cause for this exception.

Parameters

<i>msg</i>	the format string for the msg.
...	params to format into the string

6.345.2.13 virtual void decaf::lang::Exception::setStackTrace (const std::vector< std::pair< std::string, int > > & *trace*) [protected, virtual]

6.345.2.14 virtual const char* decaf::lang::Exception::what () const throw () [inline, virtual]

Implement method from std::exception.

Returns

the const char* of **getMessage()** (p. 1891).

6.345.3 Field Documentation

6.345.3.1 std::exception* decaf::lang::Exception::cause [protected]

The **Exception** (p. 1886) that caused this one to be thrown.

6.345.3.2 std::string decaf::lang::Exception::message [protected]

The cause of this exception.

6.345.3.3 std::vector< std::pair< std::string, int> > decaf::lang::Exception::stackTrace [protected]

The stack trace.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Exception.h**

6.346 cms::ExceptionListener Class Reference

If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 1893) that is registered with the **Connection** (p. 1296).

```
#include <src/main/cms/ExceptionListener.h>
```

Public Member Functions

- virtual ~**ExceptionListener** ()

- virtual void **onException** (const **cms::CMSException** &ex)=0

Called when an exception occurs.

6.346.1 Detailed Description

If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 1893) that is registered with the **Connection** (p. 1296). An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages via the asynchronous event mechanism so they would have no other way to learn that their connection has failed.

Since

1.0

6.346.2 Constructor & Destructor Documentation

- 6.346.2.1 virtual **cms::ExceptionListener::~ExceptionListener** () [inline, virtual]

6.346.3 Member Function Documentation

- 6.346.3.1 virtual void **cms::ExceptionListener::onException** (const **cms::CMSException** &ex) [pure virtual]

Called when an exception occurs.

Once notified of an exception the caller should no longer use the resource that generated the exception.

Parameters

<i>ex</i>	Exception Object that occurred.
-----------	---------------------------------

The documentation for this class was generated from the following file:

- src/main/cms/**ExceptionListener.h**

6.347 activemq::commands::ExceptionResponse Class Reference

```
#include <src/main/activemq/commands/ExceptionResponse.h>
```

Inheritance diagram for **activemq::commands::ExceptionResponse**:

Public Member Functions

- **ExceptionResponse** ()
- virtual **~ExceptionResponse** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **ExceptionResponse * cloneDataStructure** () const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **BrokerError** > & **getException** () const
- virtual **Pointer**< **BrokerError** > & **getException** ()
- virtual void **setException** (const **Pointer**< **BrokerError** > &exception)

Static Public Attributes

- static const unsigned char **ID_EXCEPTIONRESPONSE** = 31

Protected Attributes

- **Pointer**< **BrokerError** > **exception**

6.347.1 Constructor & Destructor Documentation

6.347.1.1 `activemq::commands::ExceptionResponse::ExceptionResponse ()`

6.347.1.2 `virtual activemq::commands::ExceptionResponse::~~ExceptionResponse ()`
[virtual]

6.347.2 Member Function Documentation

6.347.2.1 `virtual ExceptionResponse* activemq::commands::ExceptionResponse::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::Response` (p. 3380).

6.347.2.2 `virtual void activemq::commands::ExceptionResponse::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::Response` (p. 3380).

6.347.2.3 `virtual bool activemq::commands::ExceptionResponse::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p. 3381).

6.347.2.4 `virtual unsigned char activemq::commands::ExceptionResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1713) type copy.

Reimplemented from **activemq::commands::Response** (p. 3381).

6.347.2.5 `virtual Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException () [virtual]`

6.347.2.6 `virtual const Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException () const [virtual]`

6.347.2.7 `virtual void activemq::commands::ExceptionResponse::setException (const Pointer< BrokerError > & exception) [virtual]`

6.347.2.8 `virtual std::string activemq::commands::ExceptionResponse::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 3382).

6.347.3 Field Documentation

6.347.3.1 `Pointer<BrokerError> activemq::commands::ExceptionResponse::exception [protected]`

6.347.3.2 `const unsigned char activemq::commands::ExceptionResponse::ID_EXCEPTIONRESPONSE = 31 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ExceptionResponse.h`

6.348 activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller

Class Reference

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 1898).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/ExceptionResponseMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller`:

Public Member Functions

- **ExceptionResponseMarshaller** ()
- virtual **~ExceptionResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.348

activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller
Class Reference 1901

6.348.1 Detailed Description

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 1898).
NOTE!: This file is auto generated - do not modify! if you need to make a change,
please see the Java Classes in the activemq-openwire-generator module

6.348.2 Constructor & Destructor Documentation

6.348.2.1 **activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::ExceptionResponseMarshaller**
() [inline]

6.348.2.2 **virtual activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::~~ExceptionResponseMarshaller**
() [inline, virtual]

6.348.3 Member Function Documentation

6.348.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller**
(p. 3415).

6.348.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller**
(p. 3415).

6.348.3.3 **virtual void activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3415).

6.348.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3416).

6.348.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

6.348

activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller**Class Reference****1903****Returns**

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3417).

6.348.3.6 virtual void **activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::tightMarshal2**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**)
 [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3417).

6.348.3.7 virtual void **activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** *
dataStructure, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream**
 * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i> if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3418).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/ExceptionResponseMarshaller.h`

6.349.3 Member Function Documentation

6.349.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3395).

6.349.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3395).

6.349.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3395).

6.349.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3396).

6.349

activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller

Class Reference

1907

```
6.349.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3397).

```
6.349.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3397).

```
6.349.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3398).

Un-marshall an object instance from the data input stream.

6.350

activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller

Class Reference

1911

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3406).

```
6.350.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightMarshal1  
( OpenWireFormat * wireFormat, commands::DataStructure *  
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )  
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3407).

```
6.350.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightMarshal2  
( OpenWireFormat * wireFormat, commands::DataStructure  
  * dataStructure, decaf::io::DataOutputStream * dataOut,  
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )  
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3407).

6.350.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

6.351.3 Member Function Documentation

6.351.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3400).

6.351.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3400).

6.351.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

6.351

activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller
Class Reference **1915**
Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3400).

6.351.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 3401).

6.351.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3402).

```
6.351.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3402).

```
6.351.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3403).

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller**
 (p. 3390).

6.352

activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller

Class Reference

1919

6.352.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::looseMarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (
decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller**
(p. 3390).

6.352.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::looseUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller**
(p. 3391).

6.352.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::tightMarshal1
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3392).

```
6.352.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3392).

```
6.352.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

6.353

activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller Class Reference 1921

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3393).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**ExceptionResponseMarshaller.h**

6.353 activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 1919).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/ExceptionResponseMarshaller.h>
```
